

## Practical - 1

### Define a simple services like Converting Rs into Dollar and Call it from different platform like JAVA and .NET

- 1] create a new project and create a new webservice
- 2] now right click on the code and click on insert code > add new web service operation
- 3] after give name to operation **FtoC** and add one parameter **a** of double data type and click ok the code will auto generate .
- 4] now do the following changes in that auto generated code:

```

/*
@WebMethod(operationName = "FtoC")
public String FtoC(@WebParam(name = "a") double a) {
    //TODO write your implementation code here:
    return "The Fahrenheit Temperature "+a+" in Celsius is "+((a-32)*5/9);
}

```

Now deploy the model.

- 5] After deploying the model just right click on your web service and click on test web service . and you will get redirected to a browser page where you can check that your web service is working or not.

#### Creating java Client using jsp

- 5] now right click on web pages > new > jsp . and give name as input.jsp.

Again right click on web pages > new > jsp . and give name as output.jsp.

- 6] In input.jsp write the following code :

```

<body>
    <form action="output.jsp">
        <pre>
            Enter the temperature in Fahrenheit:<input type="text" name="t1" required>

            Enter the temperature in Celsius :<input type="text" name="t2" required>
            <input type="submit">      <input type="reset">
        </pre>
    </form>
</body>

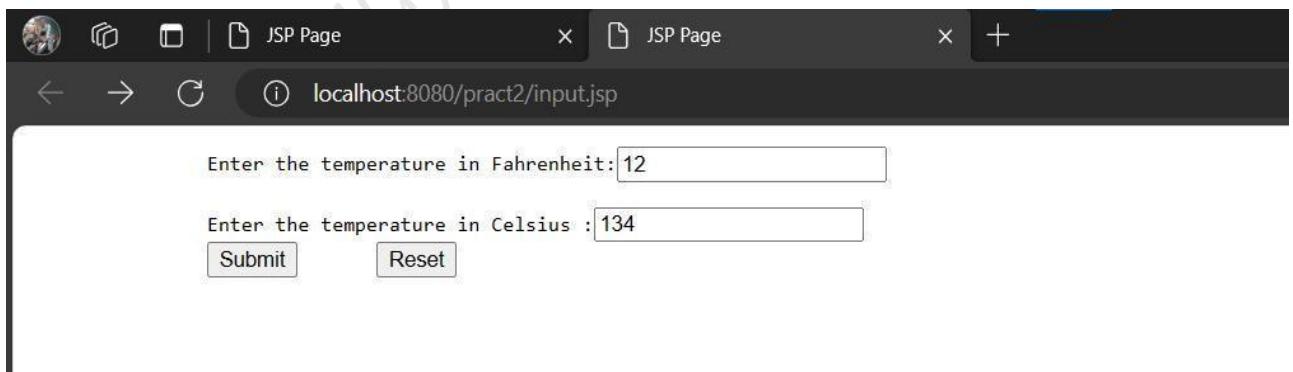

```

7] create a Web service client and give package name as “Client”. After creating web service client go to web service references and drag and drop the operations in output.jsp in body tag as shown

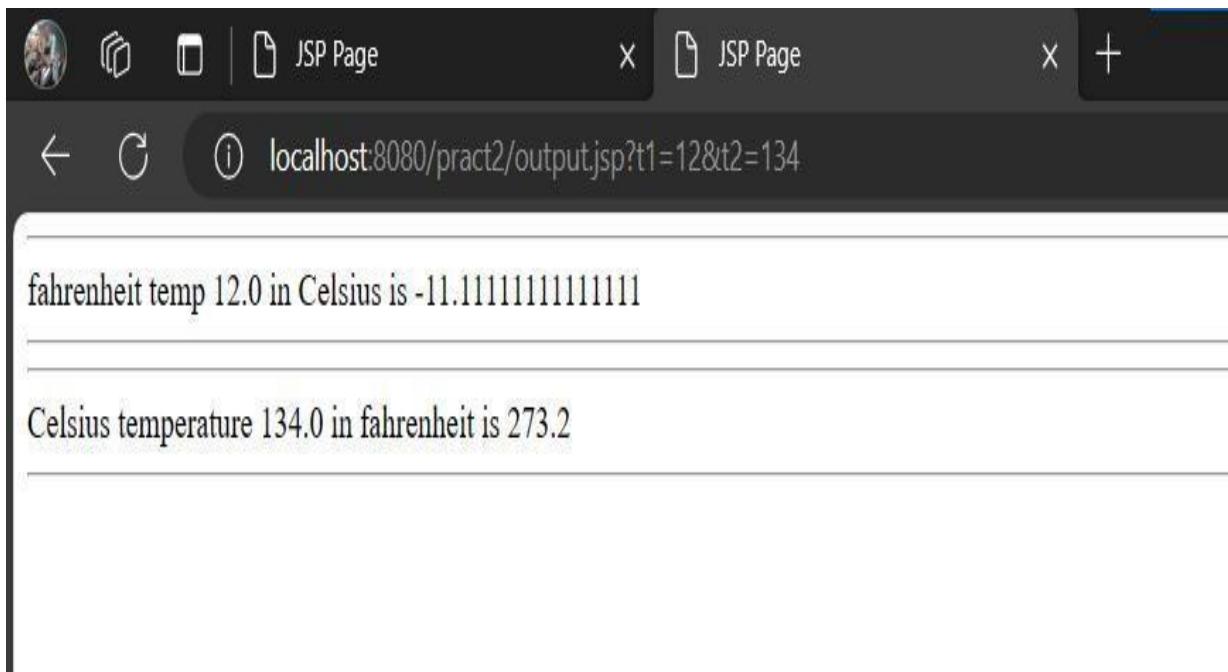

below:

```
<%-- start web service invocation --%><hr/>
<%
try {
    client.Conv_Service service = new client.Conv_Service();
    client.Conv port = service.getConvPort();
    // TODO initialize WS operation arguments here
    double a = Double.parseDouble(request.getParameter("t1"));
    // TODO process result here
    java.lang.String result = port.FtoC(a);
    out.println(result);
} catch (Exception ex) {
    // TODO handle custom exceptions here
}
%>
<%-- end web service invocation --%><hr/>
```

8] now deploy the model again and run the input.jsp file you will get redirected to the browser page as shown:

After submitting you will get the following output:

---

## Python Client

---

1] Deploy the web service and write the following code :

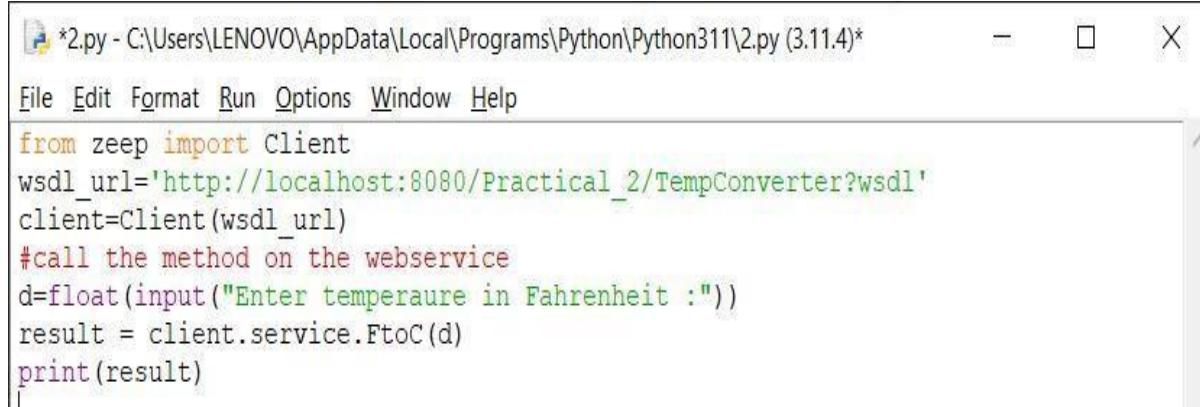

Code:

```
from zeep import Client
wsdl_url='http://localhost:8080/Practical_2/TempConverter?wsdl'
client=Client(wsdl_url)
#call the method    on the webservice
d=float(input("Enter      temperaure      in Fahrenheit      :"))
result = client.service.FtoC(d)
print(result)
```

2] replace your\_wsdl\_url with the url which was copied at the time of web service client creation .

In step no.16 . and replace the operation\_name with your method or operation name. and pass parameter to it

3] final code should look like following:

```
*2.py - C:\Users\LENOVO\AppData\Local\Programs\Python\Python311\2.py (3.11.4)*
File Edit Format Run Options Window Help
from zeep import Client
wsdl_url='http://localhost:8080/Practical_2/TempConverter?wsdl'
client=Client(wsdl_url)
#call the method on the webservice
d=float(input("Enter temperaure in Fahrenheit :"))
result = client.service.FtoC(d)
print(result)
```

**4] after running the above code you should get the following output:**

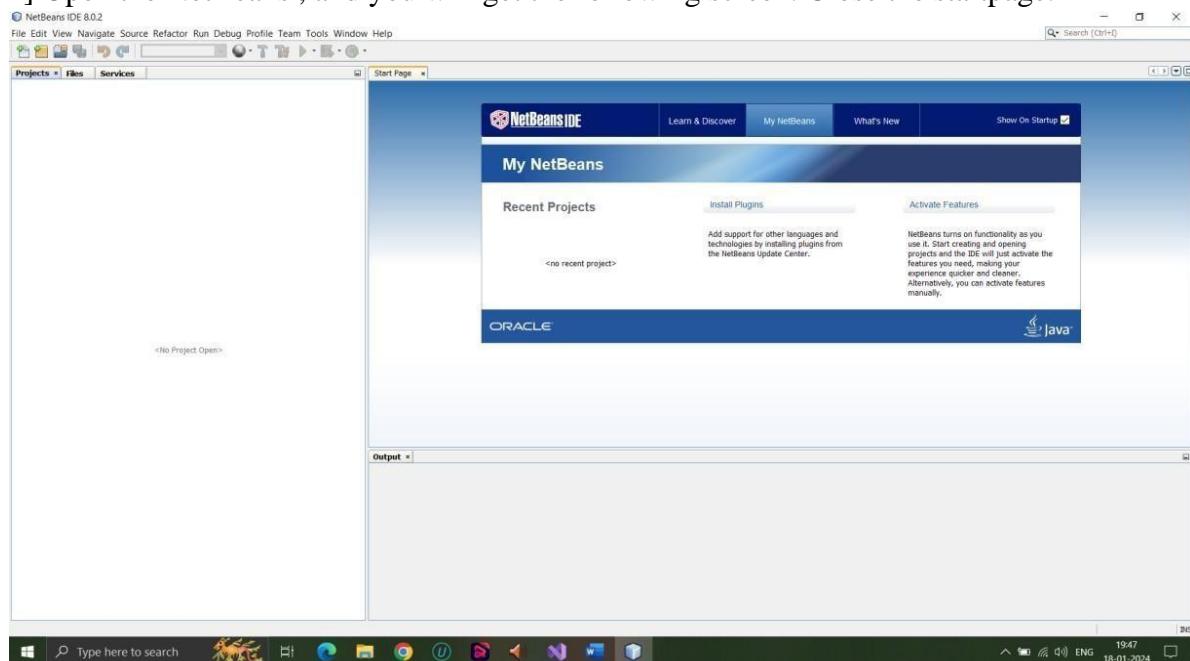

```
===== RESTART: C:\Users\LENOVO\AppData\Local\Programs\Python\Python311\2
Enter temperaure in Fahrenheit :1200
The Fahrenheit Temperature 1200.0 in Celsius is 648.8888888888889
```

## **Practical - 2**

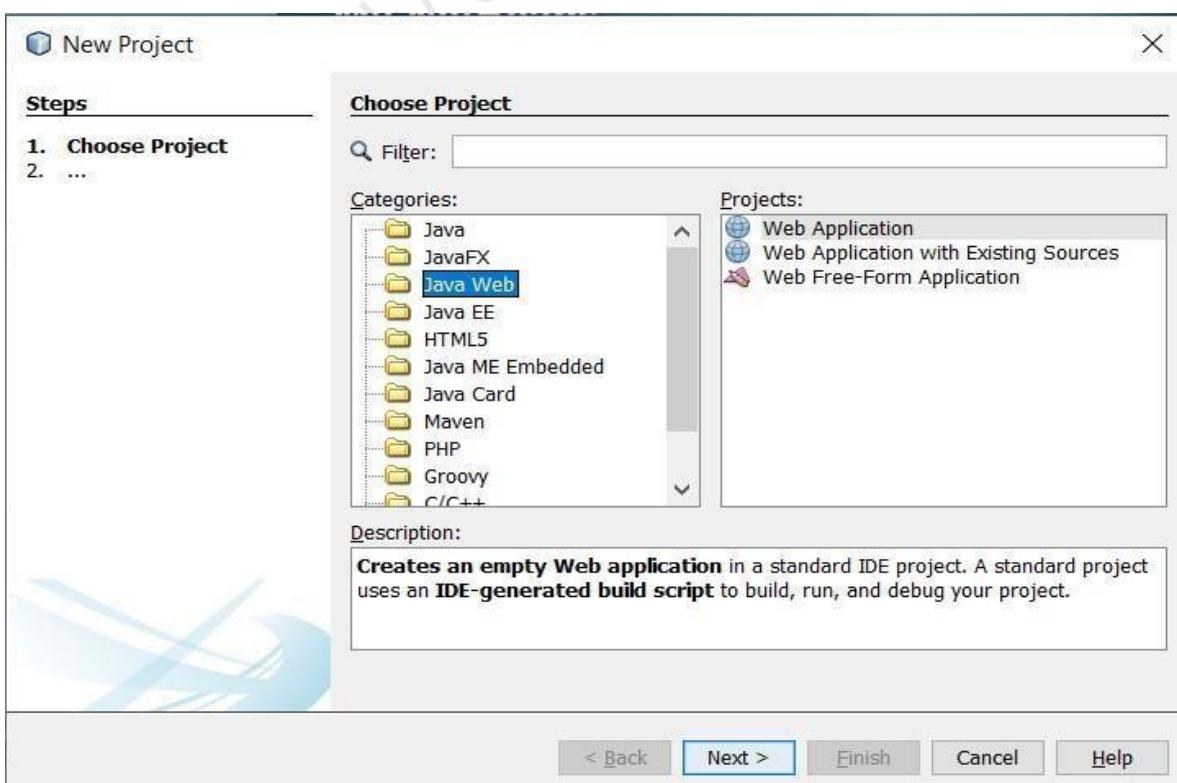

### **Create a Simple SOAP service.**

## Steps:

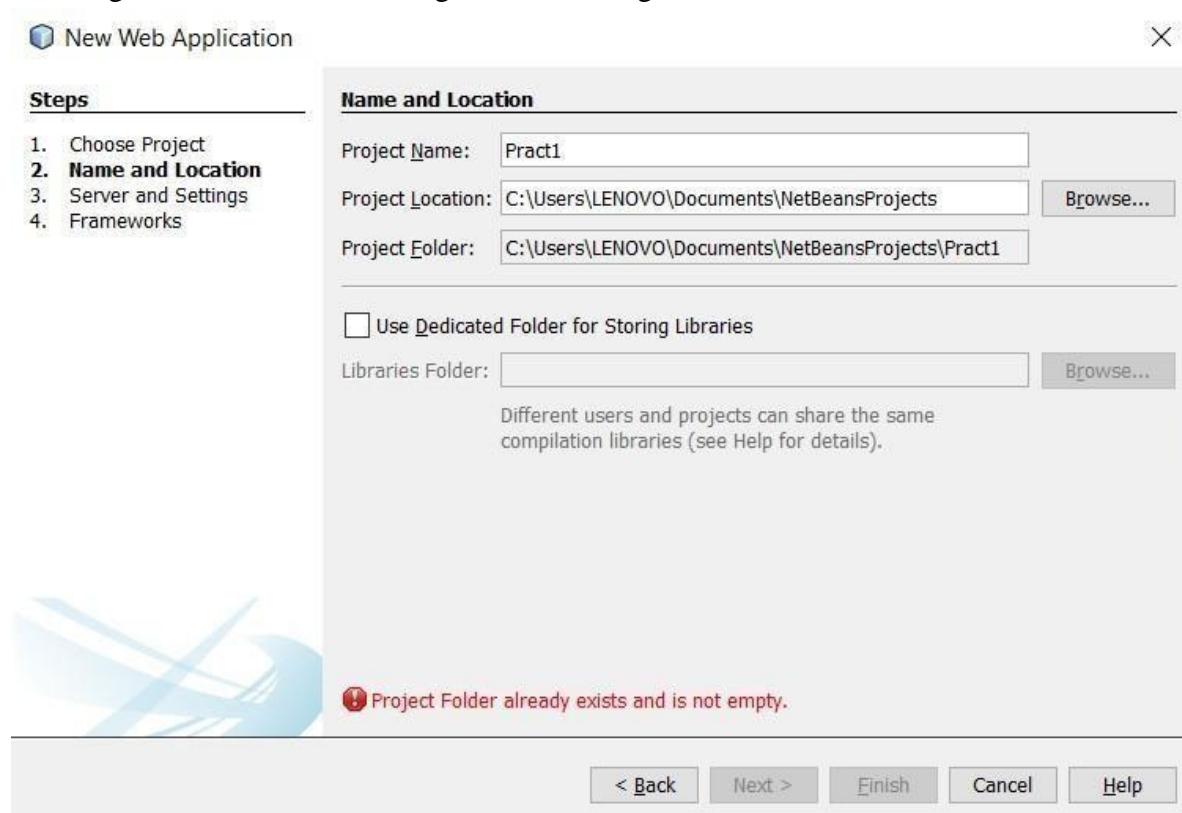

1] Open the NetBeans , and you will get the following screen. Close the startpage.

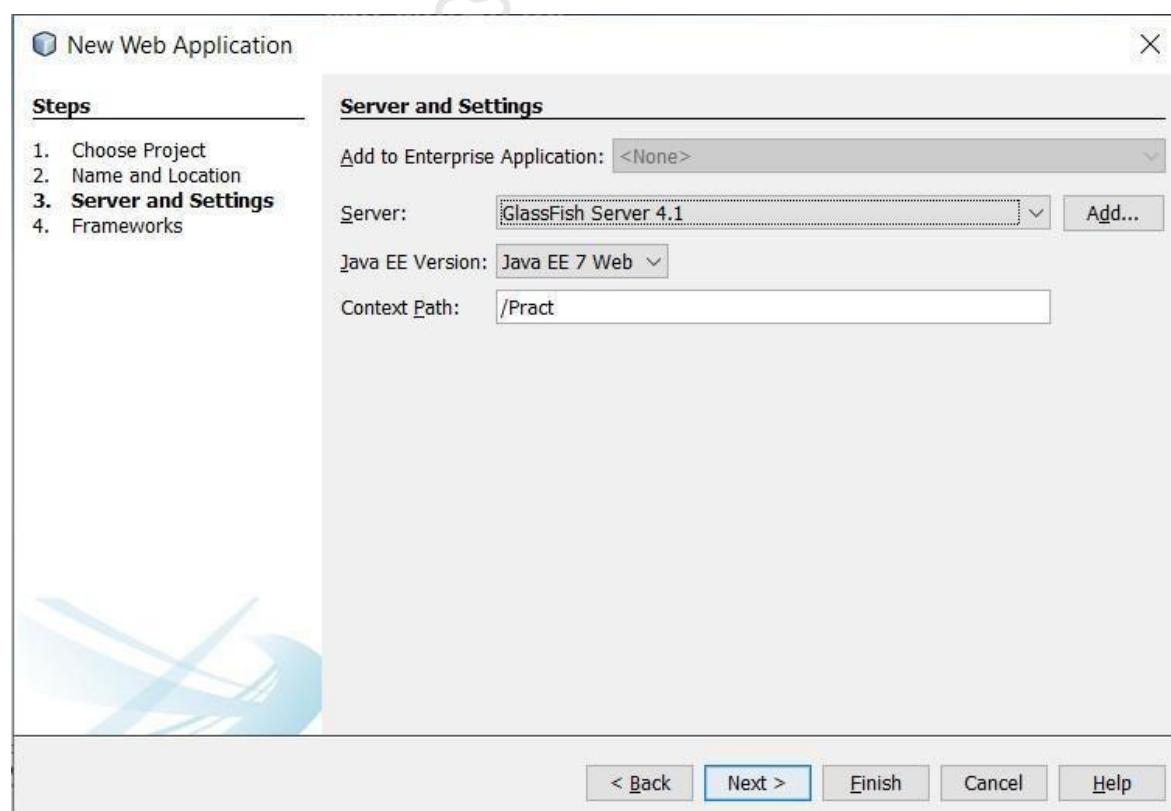

2] Now click on the file tab and click on new project you will get the following screen :

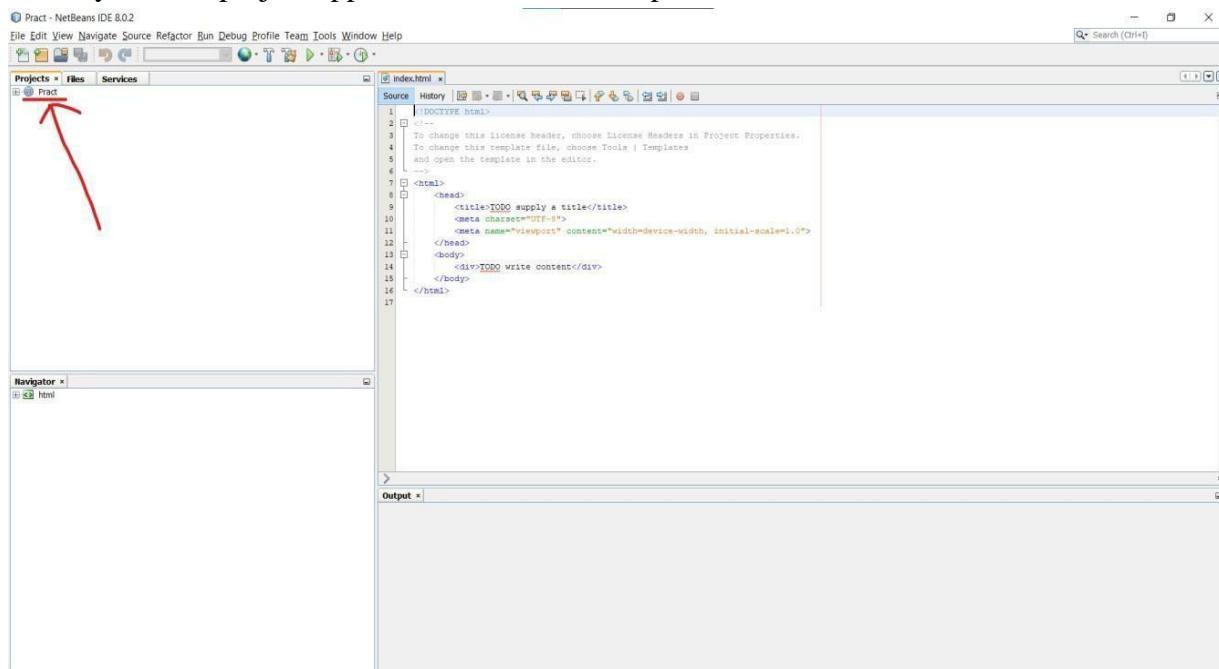

3] In Categories select Java Web and in Projects , Select Web Application .After selecting click onnext . You will get the following window:

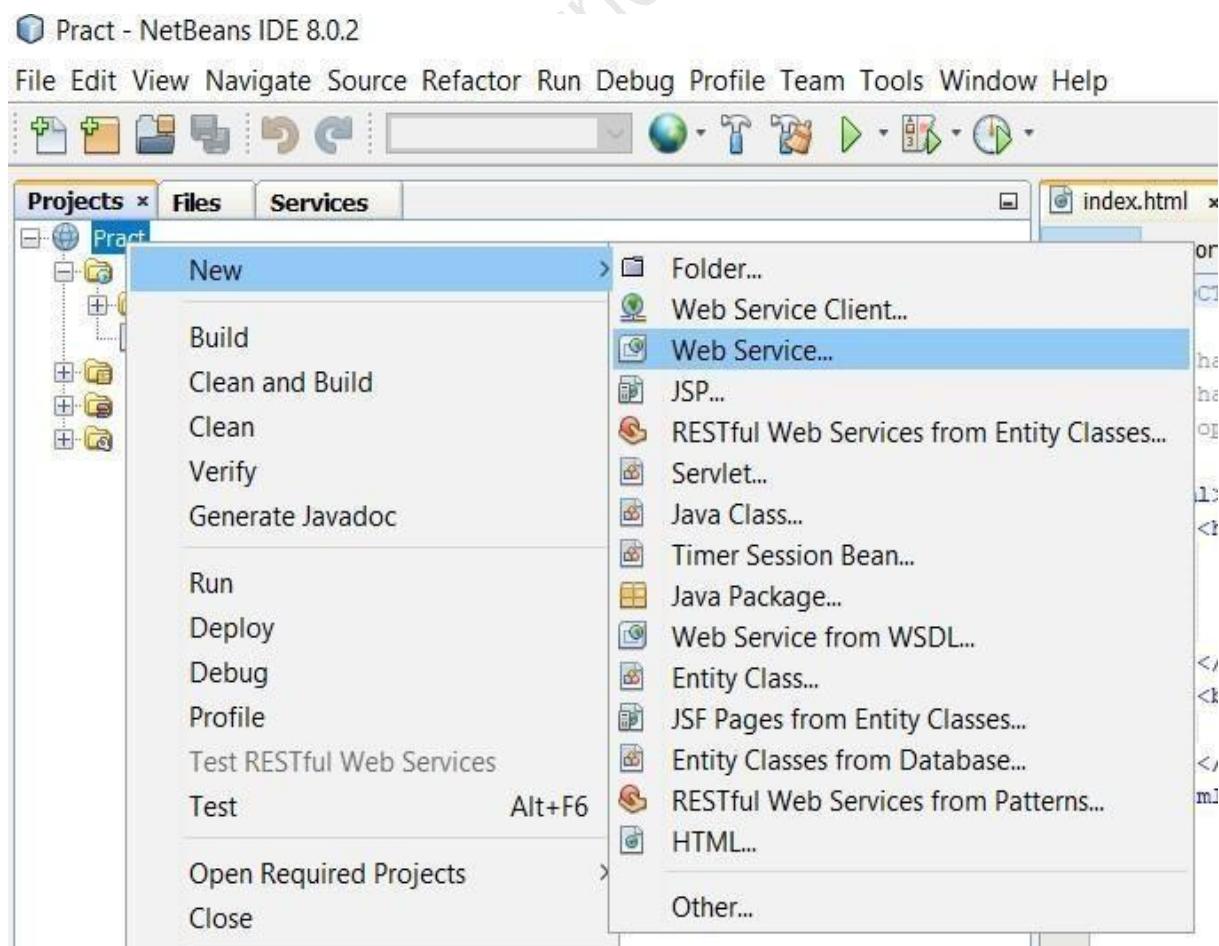

4] Now Give name to the Project Name:, and click on next . you will get the following window then again click on finish:

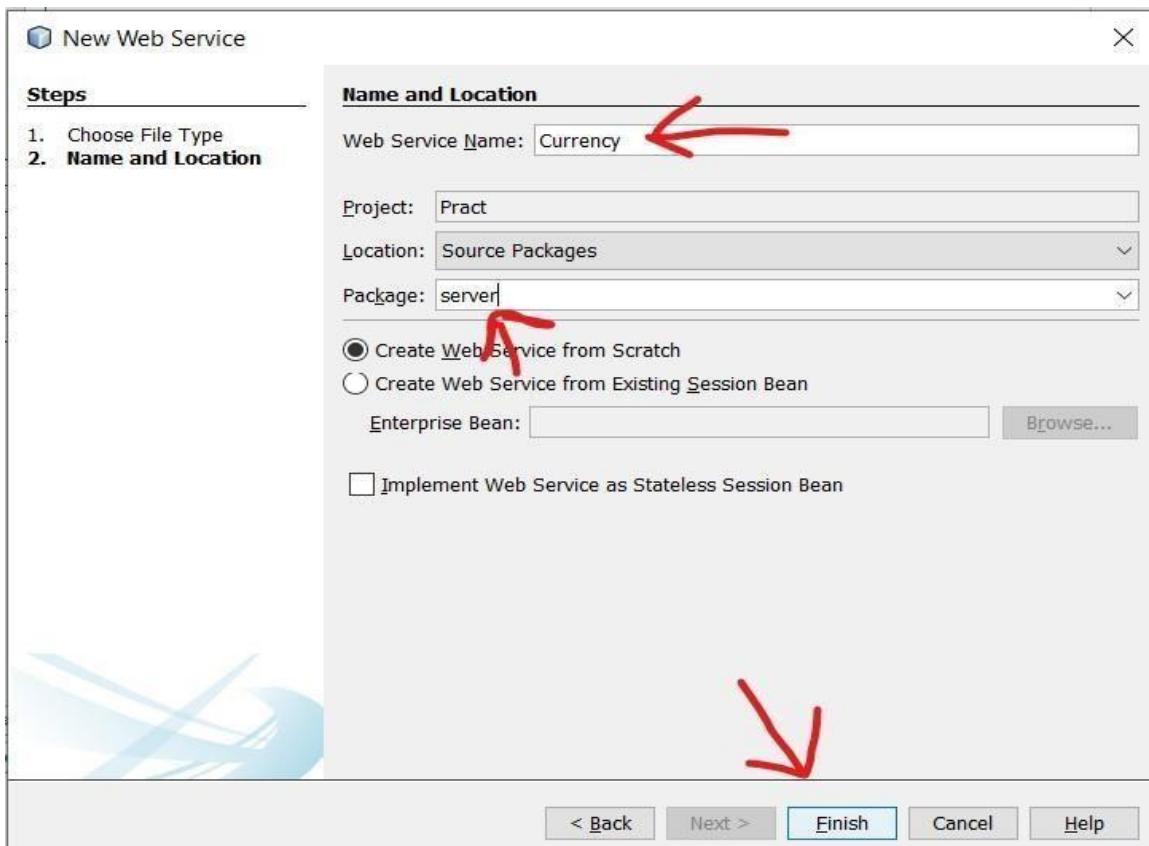

5] You will get the following screen now carefully see in projects section your recently created project appears double click to expand it:

6] Now Rightclick on the project and select new and then select Web Service, As shown Below:

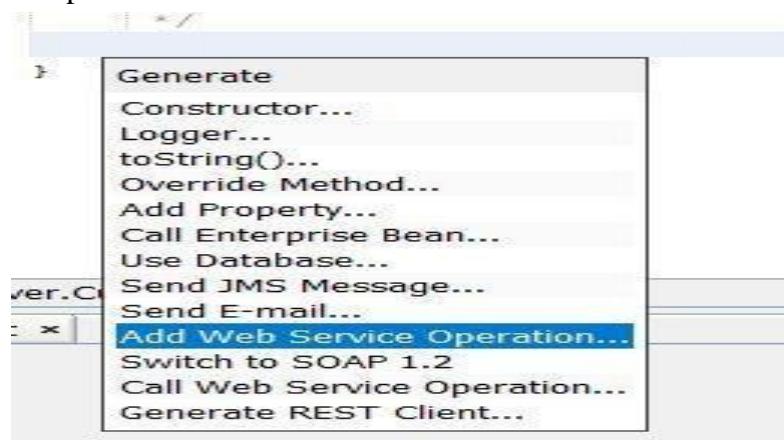

7] after clicking Web Service following window should appear , now give name to web service and give package as "server ". As shown in the image:

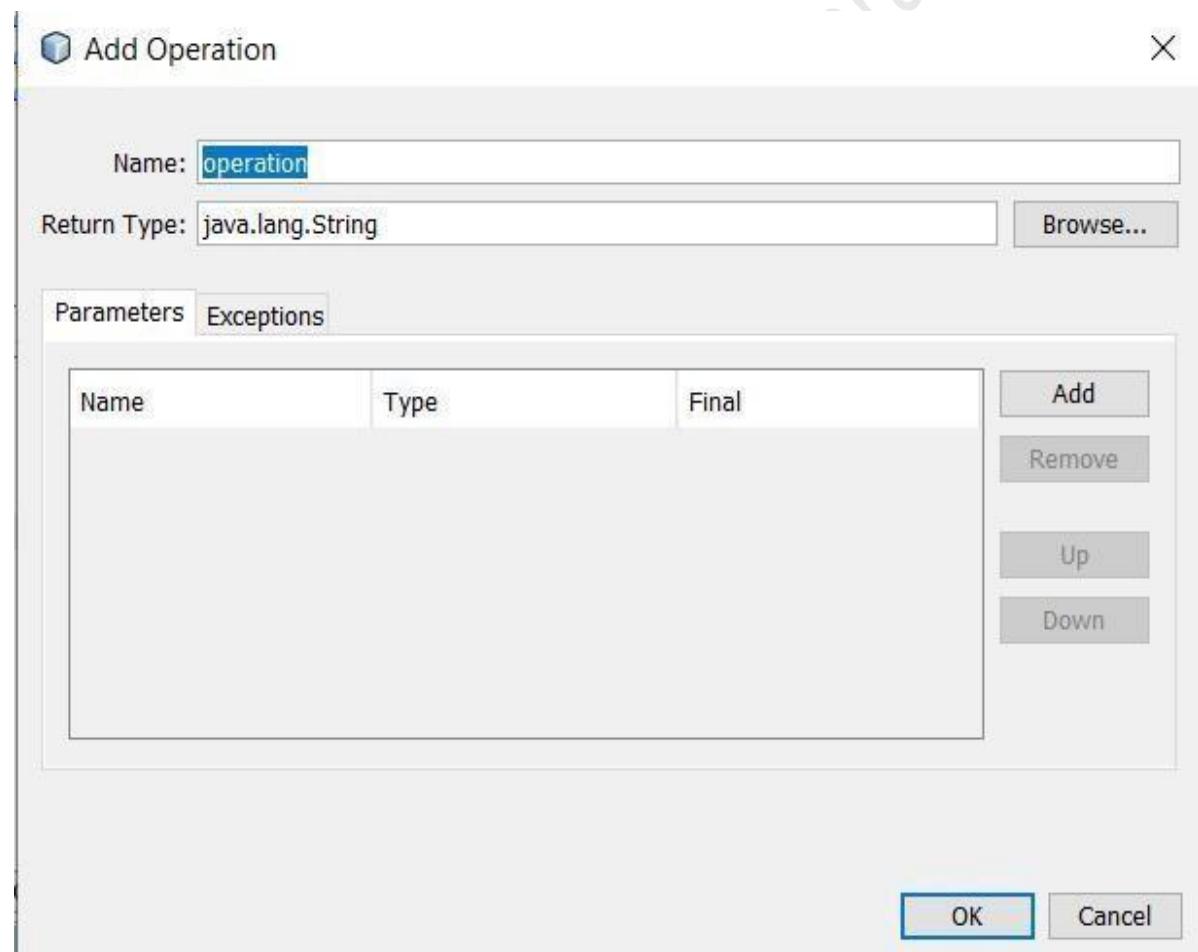

After clicking finish you should get the following window erase the mentioned code :

8] Now right click anywhere and click on insert code and select Add Web Service Operation :

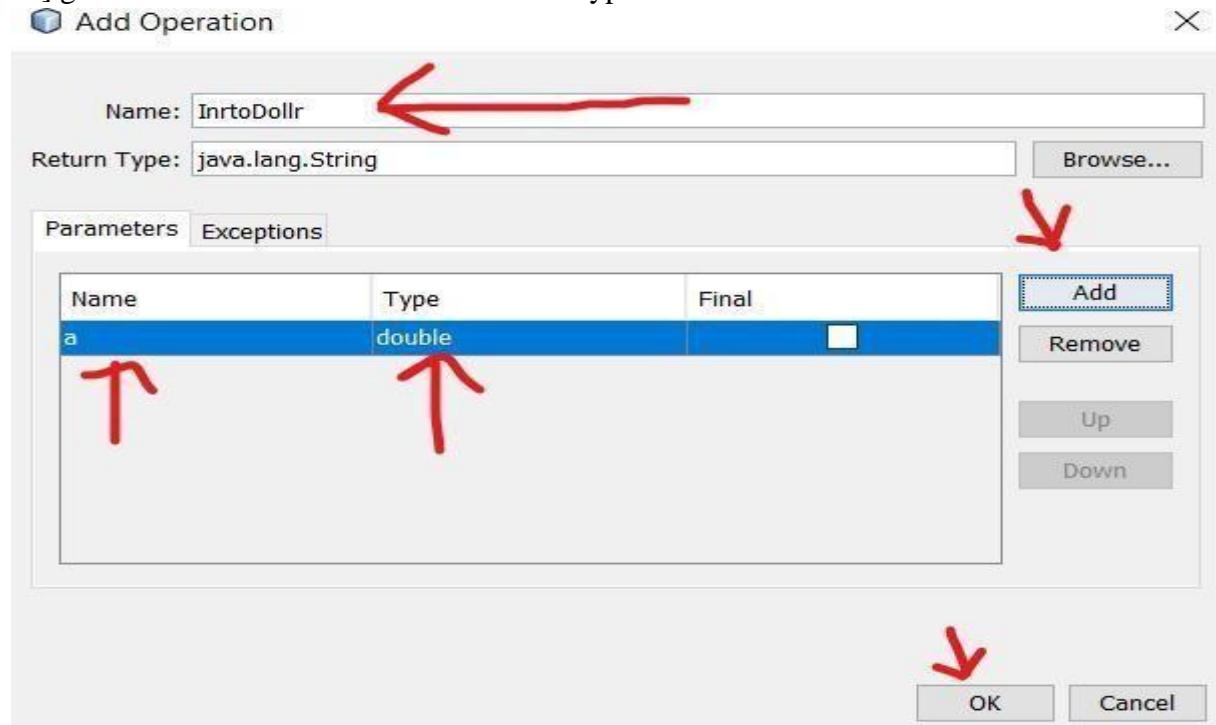

9] the following window would appear :

Just give name to the method or operation and click on add button to add parameters to the method as here we are converting dollar to rupees we should need only one parameter .

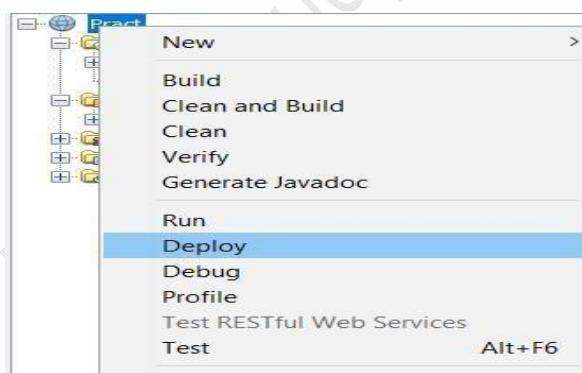

10] give the name to the variable select data type as double and click on ok as shown below:

11] After clicking ok code will autogenerate , make changes In that code as mentioned below:

```
@WebMethod(operationName = "InrtoDollar")
public String InrtoDollar(@WebParam(name = "a") double a) {
    //TODO write your implementation code here:
    return "The Indian rupees "+a+" in Dollars is "+(a/83.17);
}
```

12] now our web service is ready now right click on project and click on deploy:

13] now right click on webservice and click on test web service you will get the following output:

WSDL File)'. Below this, it says 'To invoke an operation, fill the method parameter(s) input boxes and click on the button labeled with the method name.' A section titled 'Methods :' lists a single method: 'public abstract java.lang.String server.CurrencyConvertor.inrtoDollar(double)' with an input field for 'inrtoDollar' containing the value '1233'."/&gt;

**Method parameter(s)**

Type	Value
double	1233

**Method returned**

```
java.lang.String : "The Indian rupees 1233.0 in Dollars is 14.825057111939401"
```

**SOAP Request**

```
<?xml version="1.0" encoding="UTF-8"?><S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/" xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/">
<SOAP-ENV:Header/>
<S:Body>
<ns2:InrtoDollar xmlns:ns2="http://server/">
<a>1233.0</a>
</ns2:InrtoDollar>
</S:Body>
</S:Envelope>
```

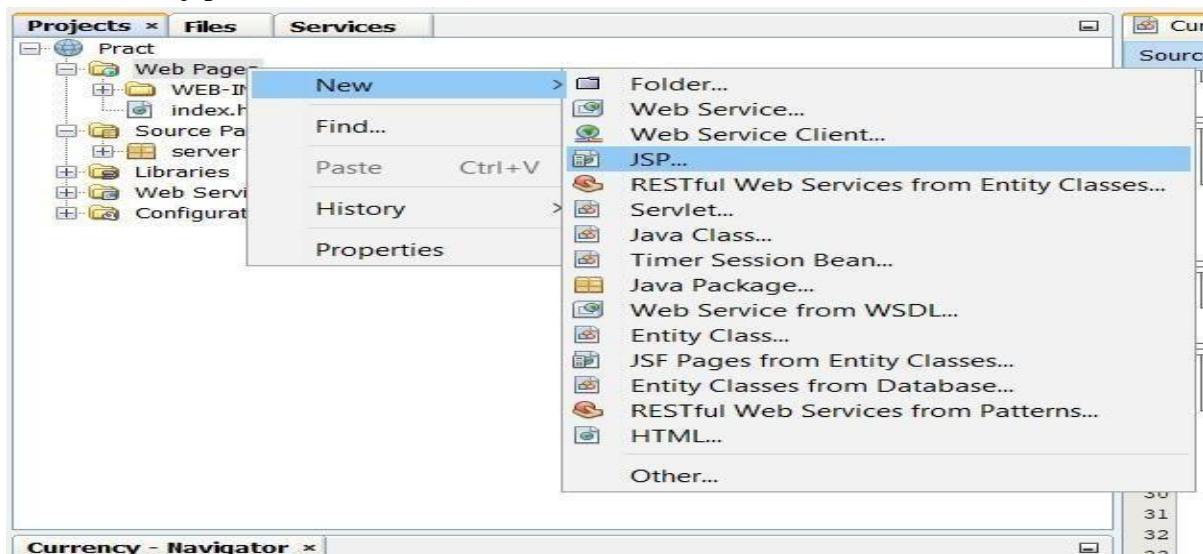

**SOAP Response**

```
<?xml version="1.0" encoding="UTF-8"?><S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/" xmlns:SOAP-ENV="http://schemas.xmlsoap.org/soap/envelope/">
<SOAP-ENV:Header/>
<S:Body>
<ns2:InrtoDollarResponse xmlns:ns2="http://server/">
<return>The Indian rupees 1233.0 in Dollars is 14.825057111939401</return>
</ns2:InrtoDollarResponse>
</S:Body>
</S:Envelope>
```

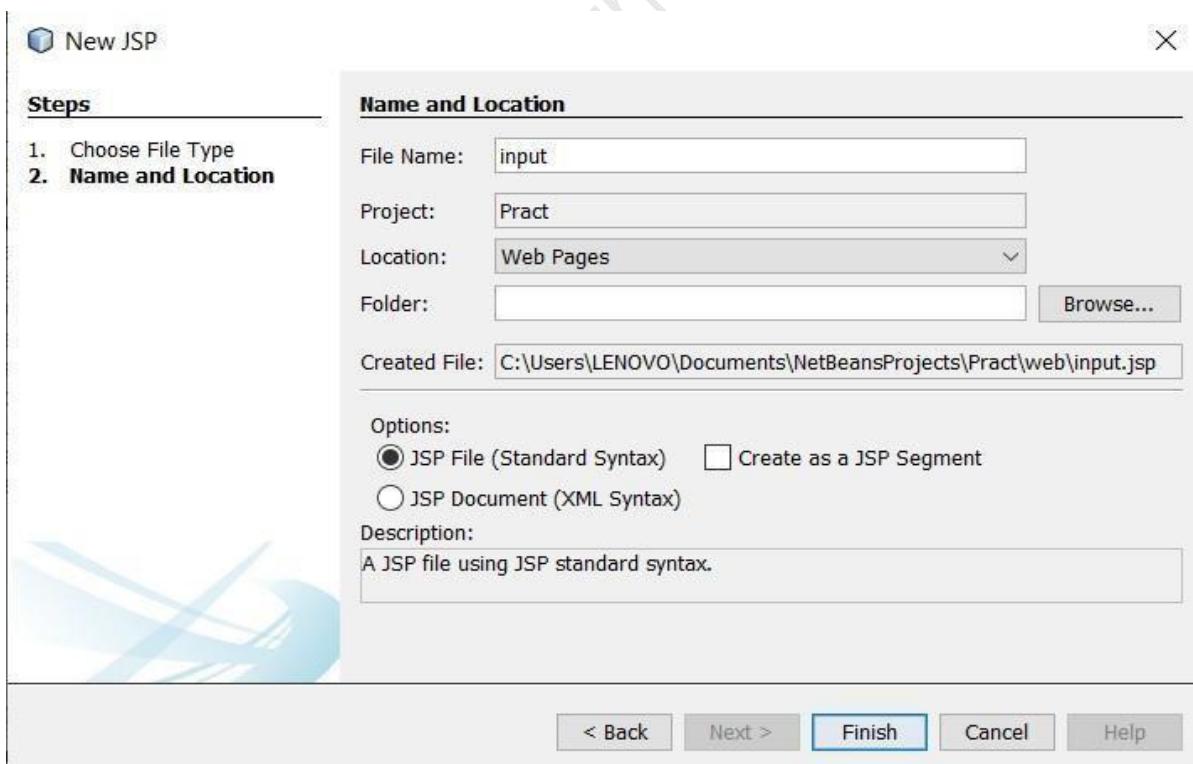

So this is how we created our web service and deployed it.

### Creating a java Client using jsp

14] now our web service is successfully deployed. Right click on web pages and select new and select jsp as shown below:

15] give name and click on finish as shown below do it 2 times on for input and one for output:

16] In input.jsp create a form for taking user input as shown below:

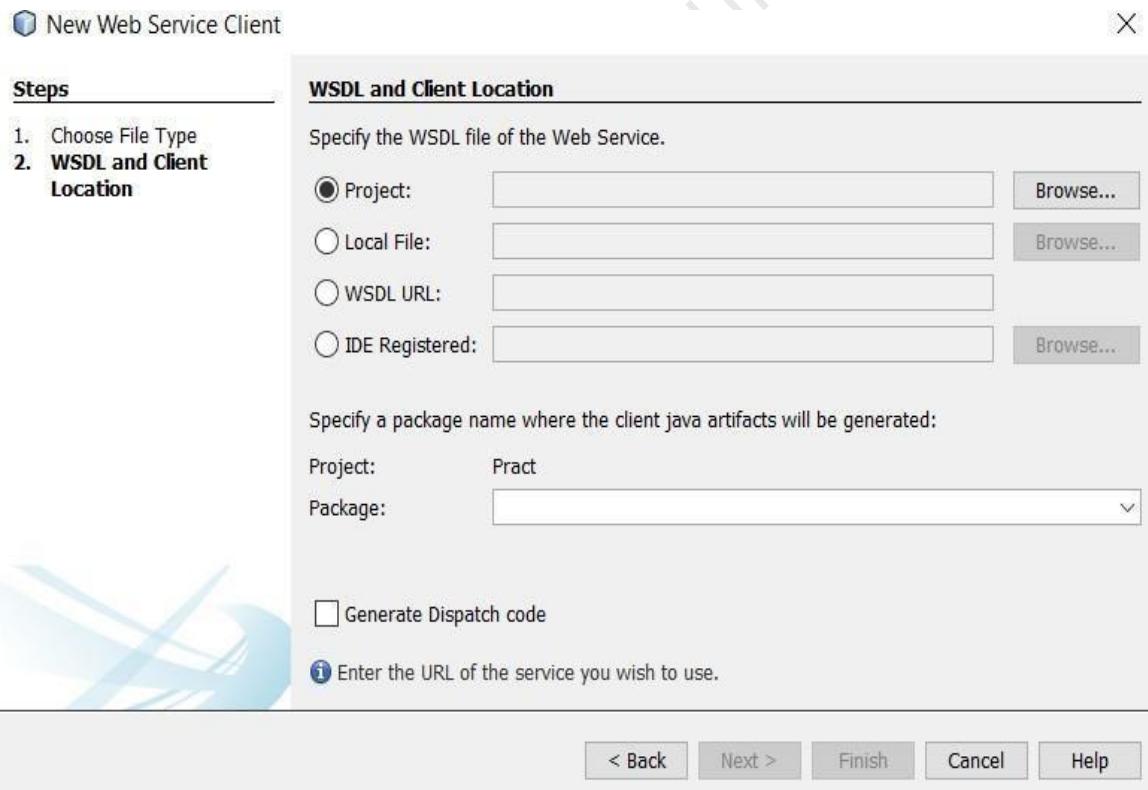

```

<!DOCTYPE html>
<html>
    <head>
        <meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
        <title>JSP Page</title>
    </head>
    <body>
        <form action="output.jsp">
            <pre>
                Enter the currency in rupees : <input type="text" name="t1">
                <input type="submit"> <input type="reset">
            </pre>
        </form>
    </body>
</html>

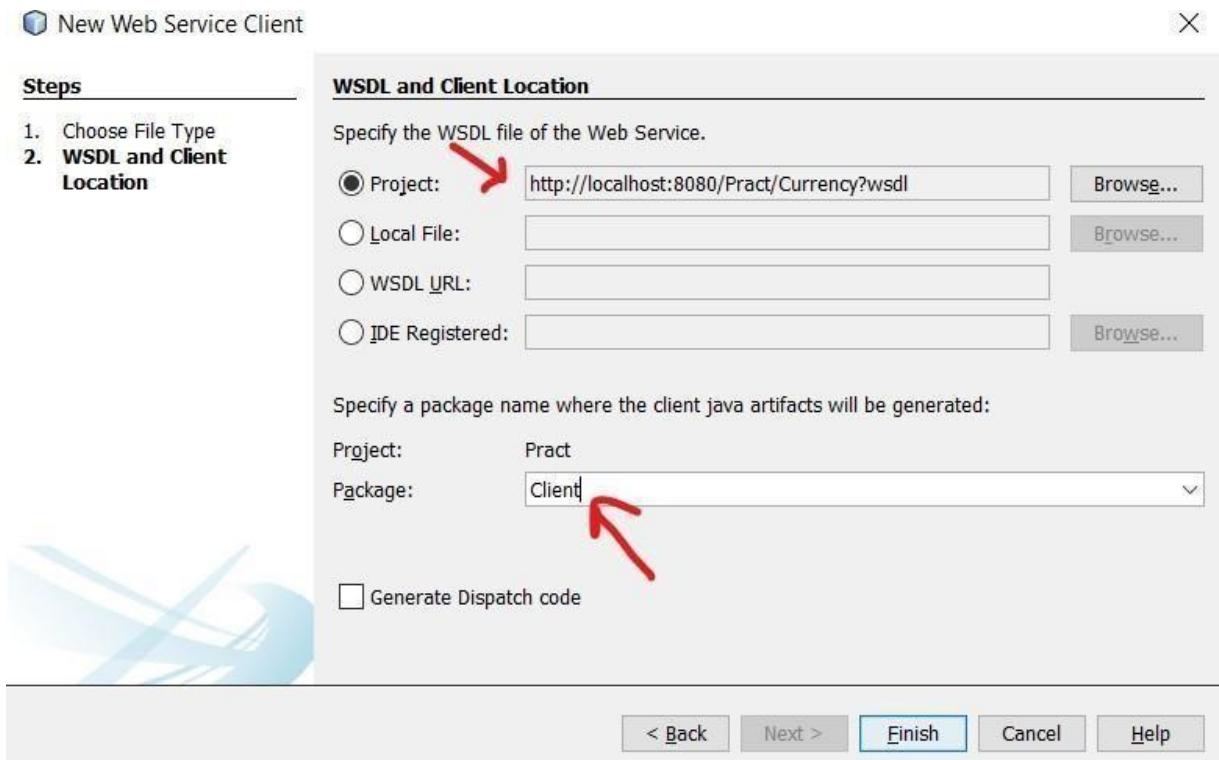

```

In this code set **action = the jsp file where u want output and give name to textbox input.**

17] now we have to create web service client, for same right click on project and select new then select web service client you will get the following screen:

At this step click on browse and select your project and click ok after clicking ok you will get wsdl url as shown below:

**At this stage copy the url and paste it in notepad for future.**

**Give package name as "Client".**

**Now click on finish.**

18] now in project section you can see a new folder is been created named "web servicerefrence". double click to expand it you should get the following:

Hold the operation or your operation name and drag it into the output.jsp in body tag as shown

**: You will get the following auto generated code:**

```
<body>
    <%-- start web service invocation --%><hr/>
<%
try {
    Client.Currency_Service service = new Client.Currency_Service();
    Client.Currency port = service.getCurrencyPort();
    // TODO initialize WS operation arguments here
    double a = 0.0d;
    // TODO process result here
    java.lang.String result = port.operation(a);
    out.println("Result = "+result);
} catch (Exception ex) {
    // TODO handle custom exceptions here
}
%>
<%-- end web service invocation --%><hr/>

</body>
```

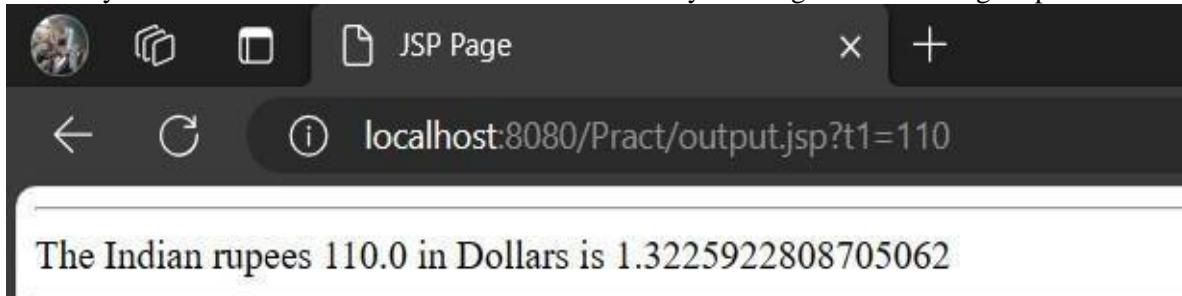

19] now make changes as shown below in the code:

```
<%-- start web service invocation --%><hr/>
<%
try {
    Client.Currency_Service service = new Client.Currency_Service();
    Client.Currency port = service.getCurrencyPort();
    // TODO initialize WS operation arguments here
    double a = Double.parseDouble(request.getParameter("t1"));
    // TODO process result here
    java.lang.String result = port.operation(a);
    out.println(result); ←
} catch (Exception ex) {
    // TODO handle custom exceptions here
}
%>
<%-- end web service invocation --%><hr/>
```

20] now Deploy our project again and right click on input.jsp and click run file you will redirect to a browser page as shown :

Enter any numerical value in text box and click on submit you will get the following output:

## Python client:

1] for consuming java web services in python we should repeat the above steps till step np.19 .

**Note: for getting output the project or web service should be deployed .**

After doing all of the steps write the following code in python idle:

## Code:

```
from zeep import Client  
  
wsdl_url='http://localhost:8080/pract/Currency?wsdl'  
  
client=Client(wsdl_url)  
  
#call the method on the webservice  
  
d=float(input("Enter Currency in Indian Rupees:"))  
  
result = client.service.InrtoDollar(d)  
  
print(result) 2] replace wsdl_url with the url which was copied at the time of web service client  
1.
```

In step no.17 . and replace the InrtoDollar with your method or operation name. and pass parameter to it

3] final code should look like following:

The screenshot shows a Windows Notepad window with Python code. The title bar reads "2.py - C:\Users\LENOVO\AppData\Local\Programs\Python\Python311\2.py (3.11.4)". The menu bar includes File, Edit, Format, Run, Options, Window, and Help. The code itself is as follows:

```
from zeep import Client
wsdl_url='http://localhost:8080/pract/Currency?wsdl'
client=Client(wsdl_url)
#call the method on the webservice
d=float(input("Enter Currency in Indian Rupees:"))
result = client.service.InrtoDollar(d)
print(result)
```

4] after running the above code you should get the following output:

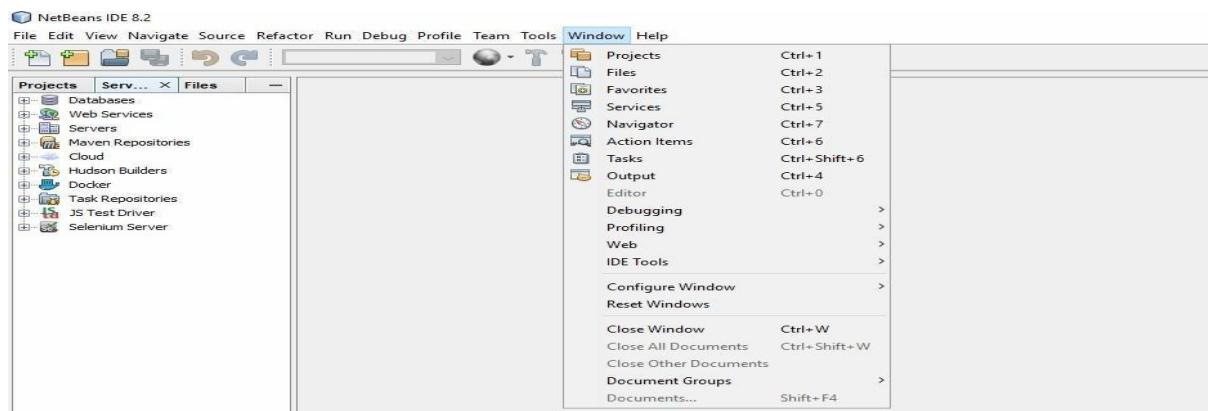

```
= RESTART: C:\Users\LENOVO\AppData\Local\Programs\Python\Python311\2.py
Enter Currency in Indian Rupees:12000
The Indian rupees 12000.0 in Dollars is 144.28279427678248
```

## Practical - 3

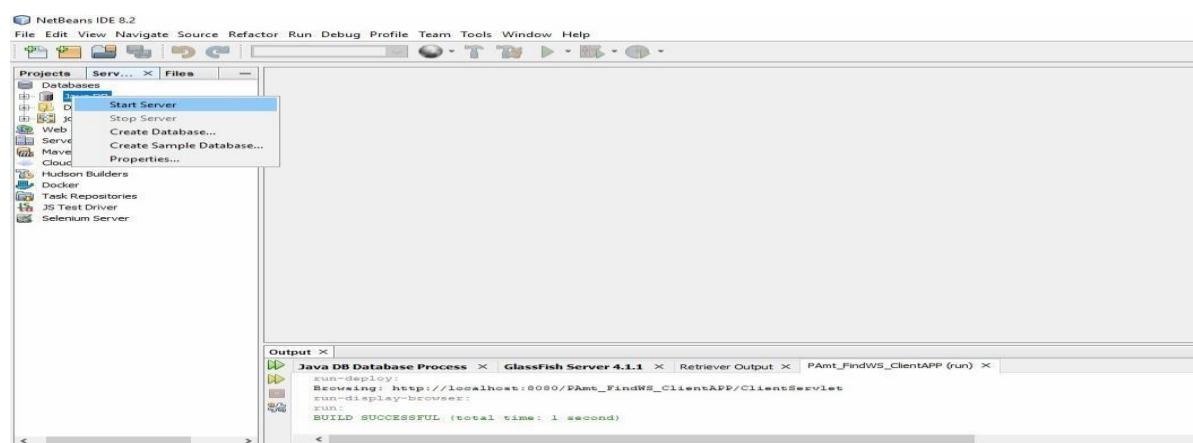

### Create a Simple REST Service to demonstrate CRUD operations with “Student” database

#### Steps:

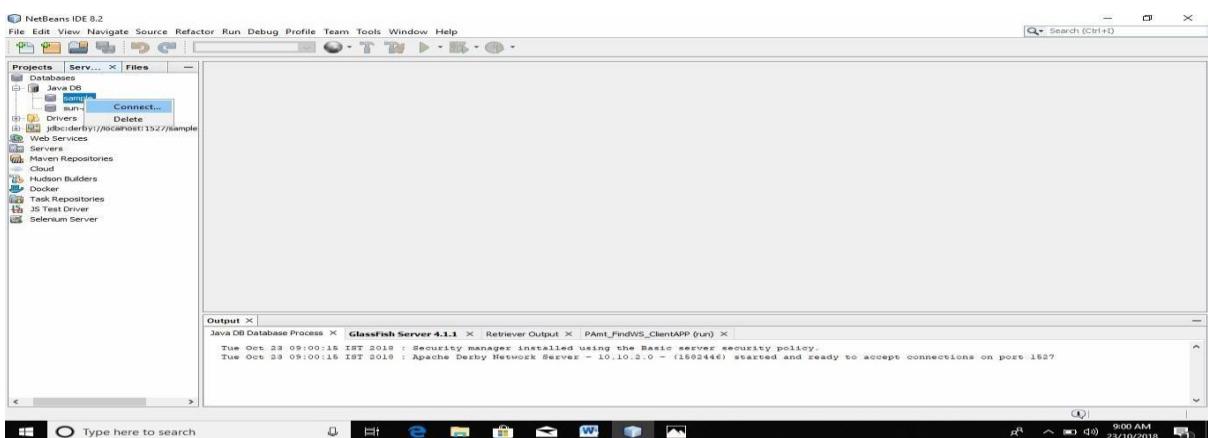

1. Click on Window menu and click on Projects, Files & Services to open it.

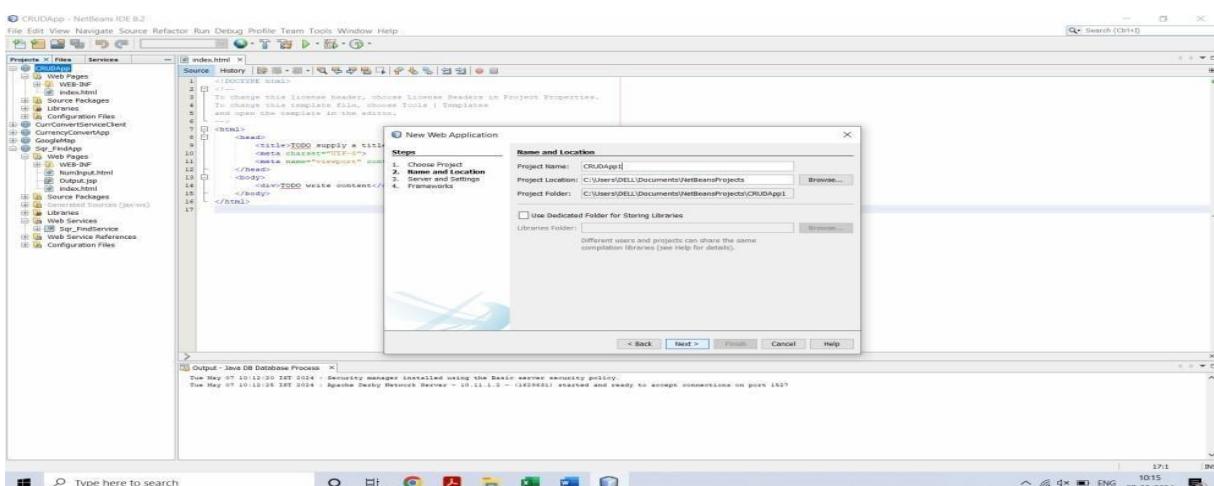

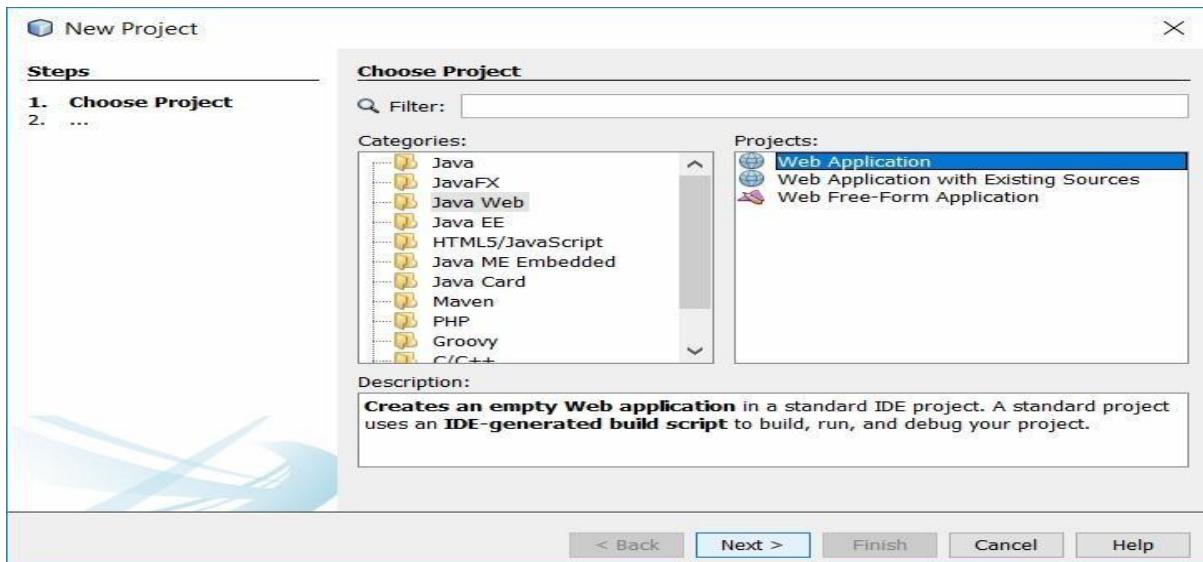

2. Right click on Java DB and then click on Start Server to start the server .

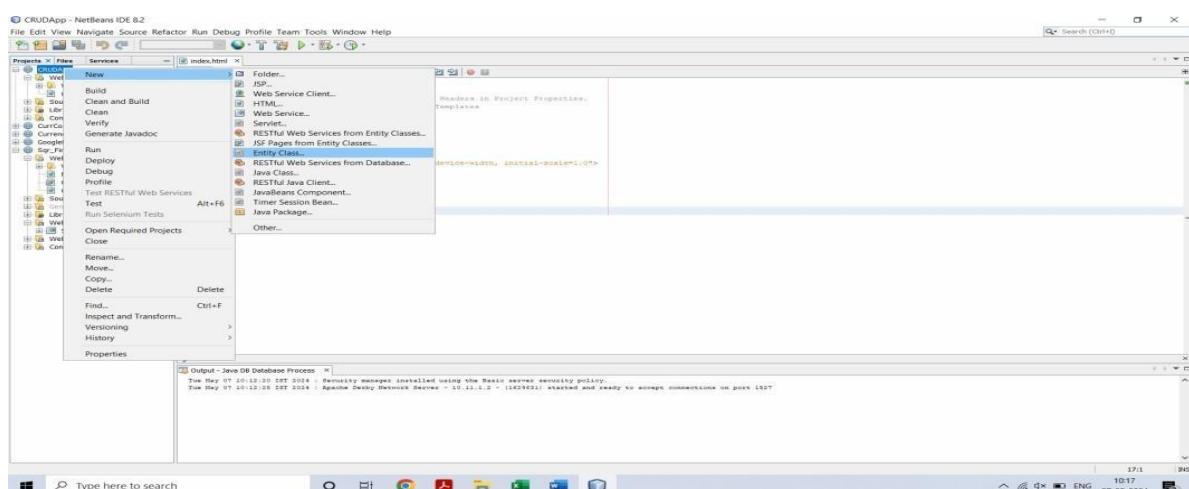

3. Now expand Java DB and right click on sample and then click on connect to connect the sample database with server.

4. Now create a web application with the name CRUD\_Operation. A window will open like following pic.

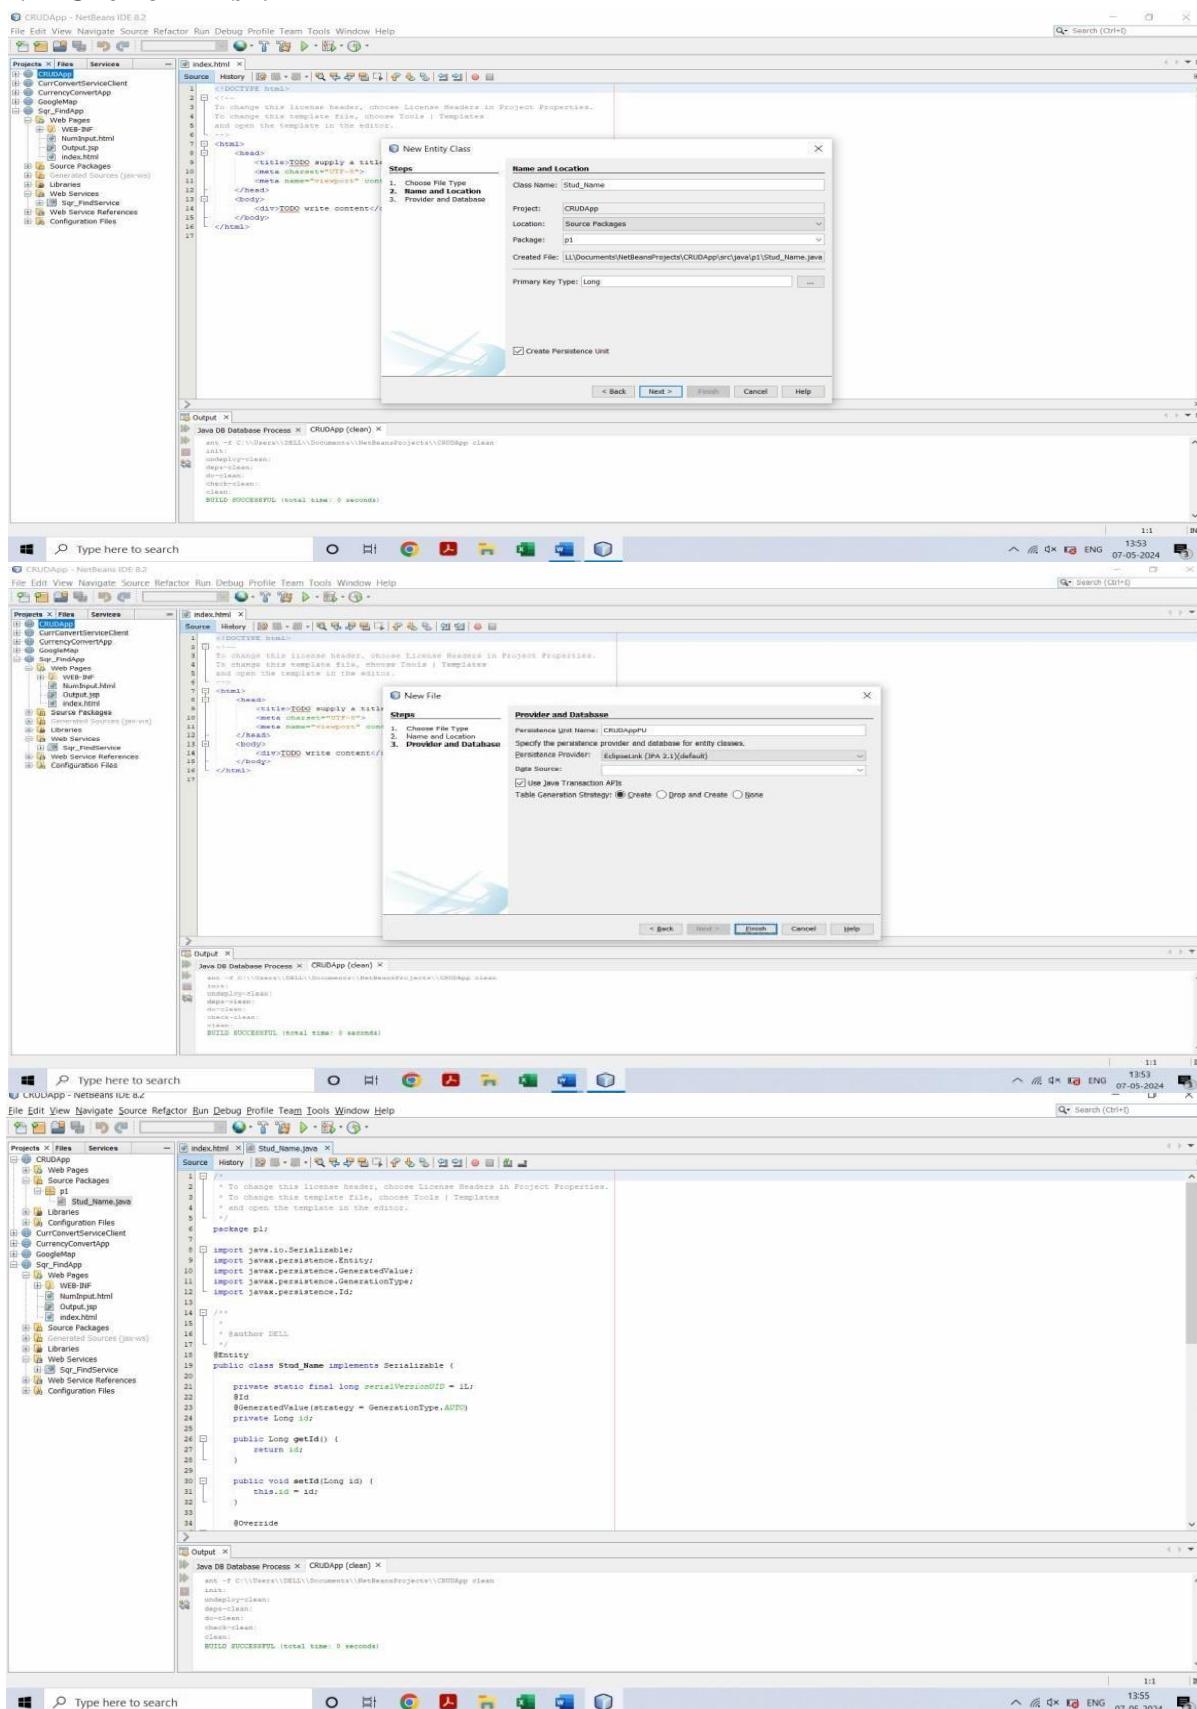

5. Create an entity class. Right click on project name -> New -> Entity Class.

6. A window will appear like bellow pic. Enter following data and click on Next ....

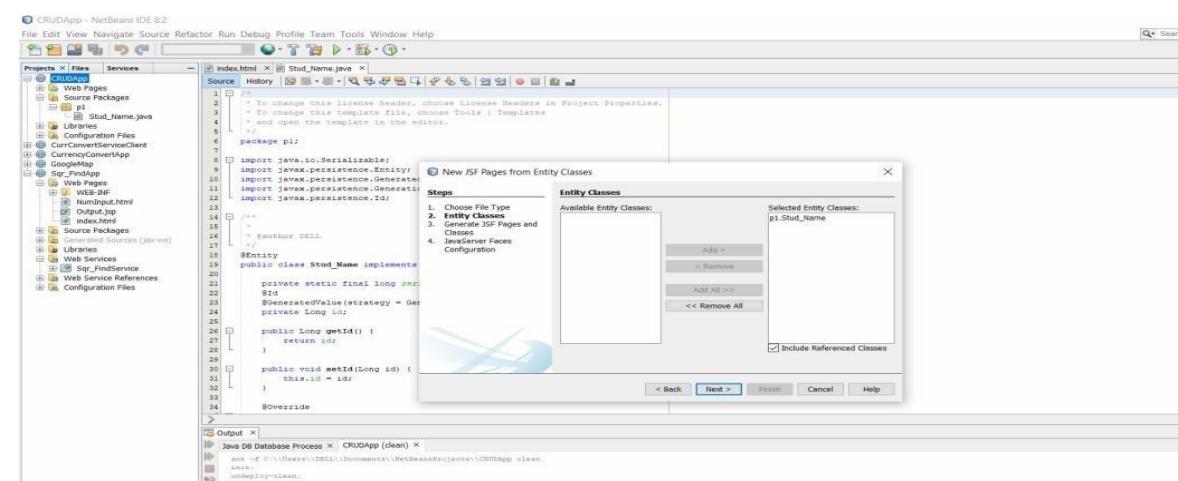

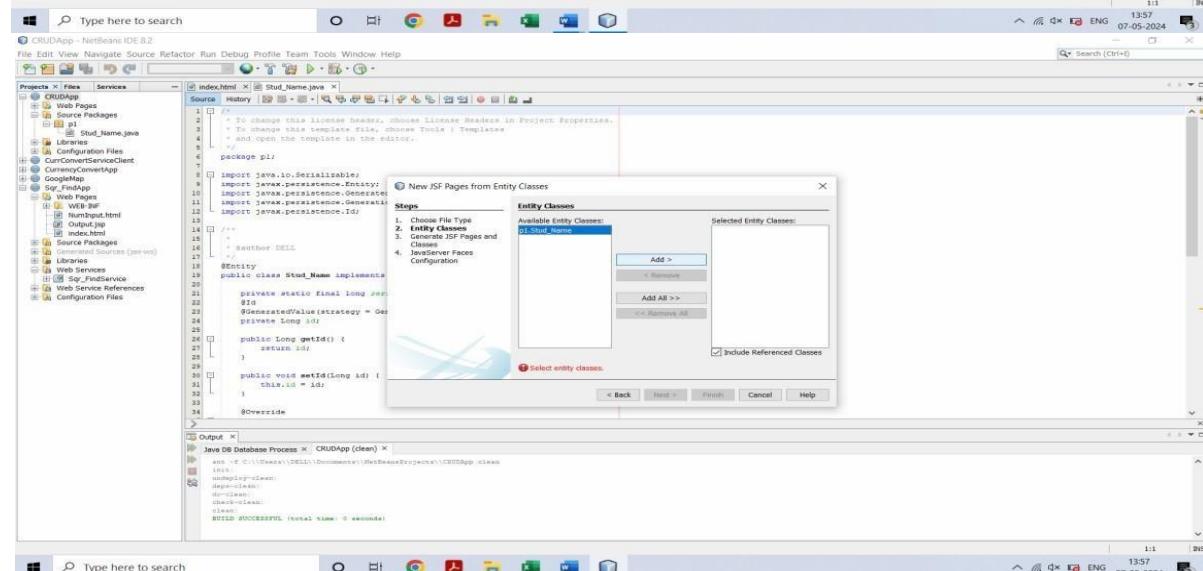

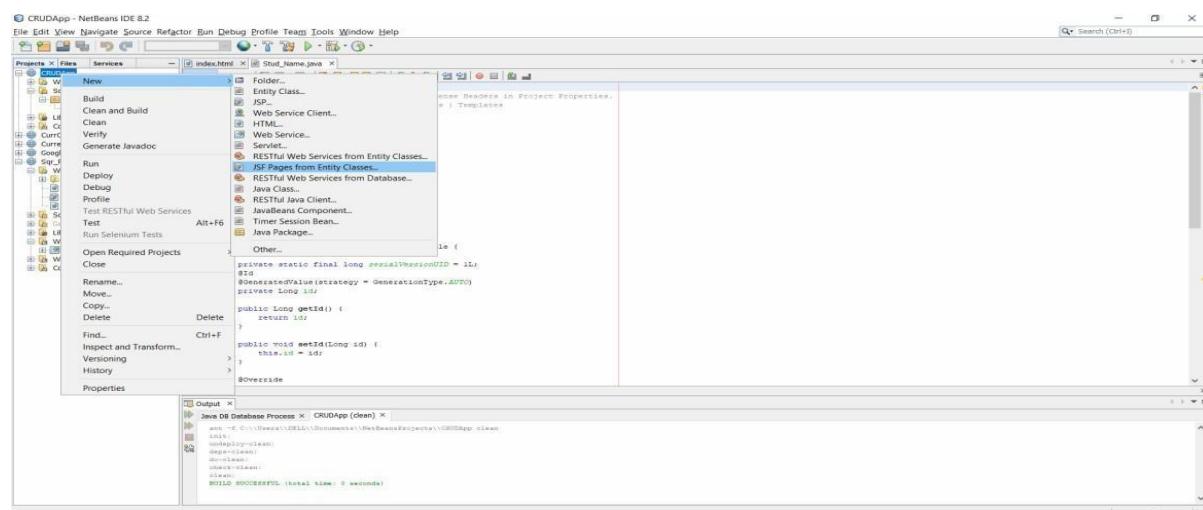

Class Name -> Stud\_Name      Package Name -> p1

7. Click on finish.

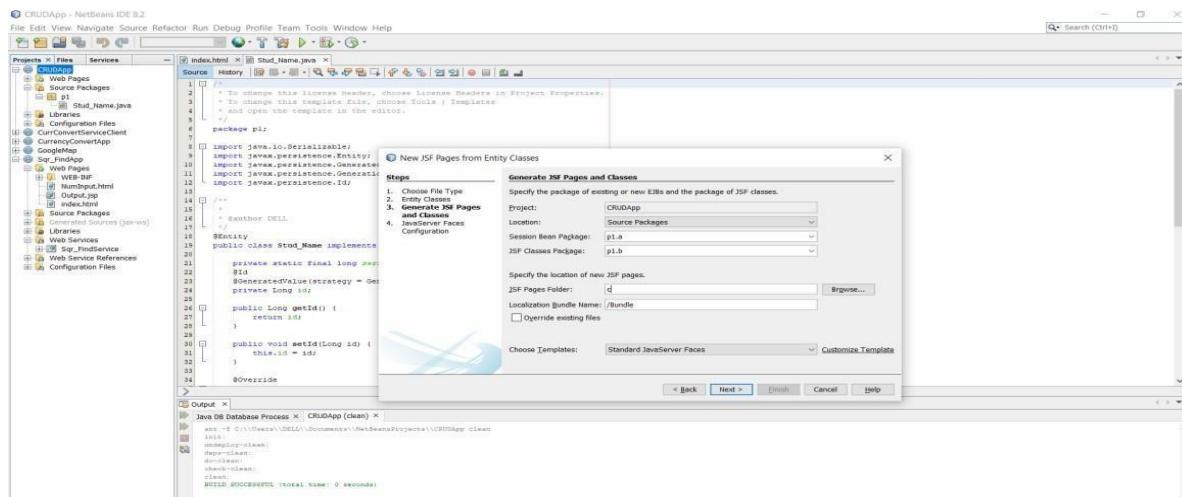

## 8. Right click on project name and create JSF Pages from Entity Classes.

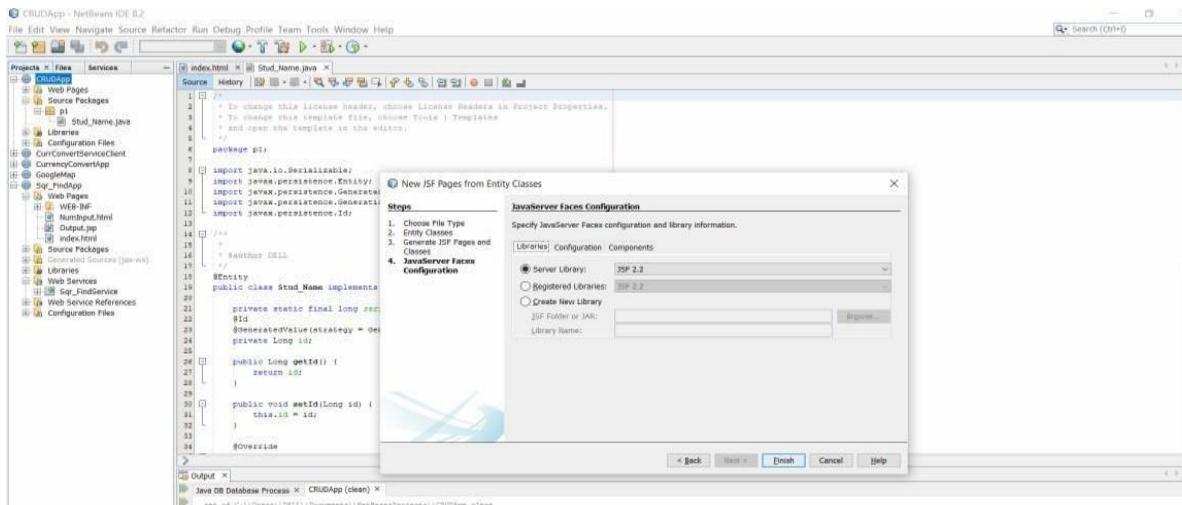

## 9. Select and click on Add button and then Next button on below

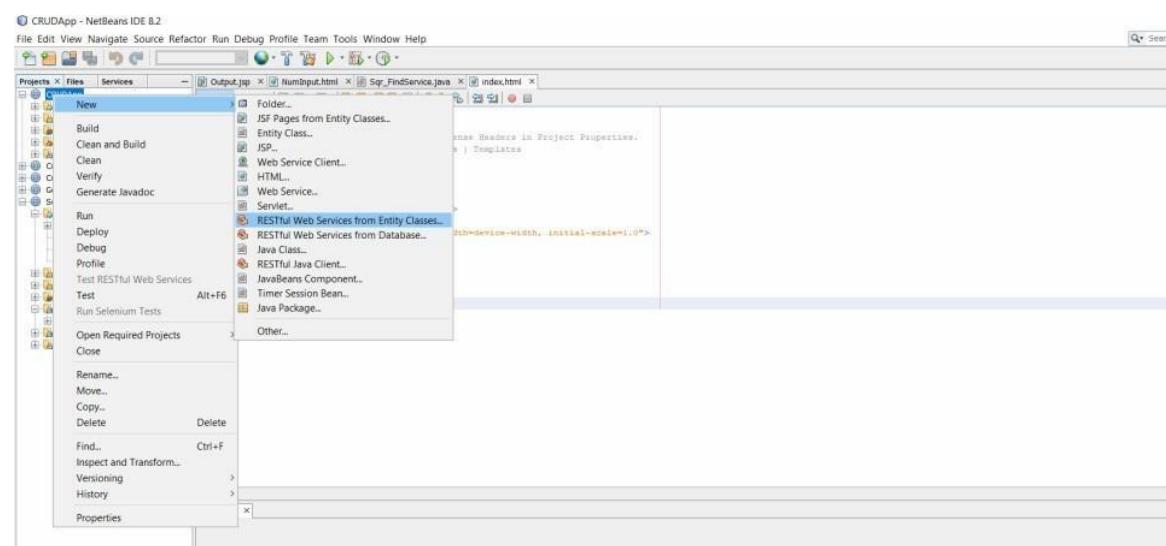

**10. A window like below will appear on the screen. Enter the data into that window as entered in below pic and click on Next button.**

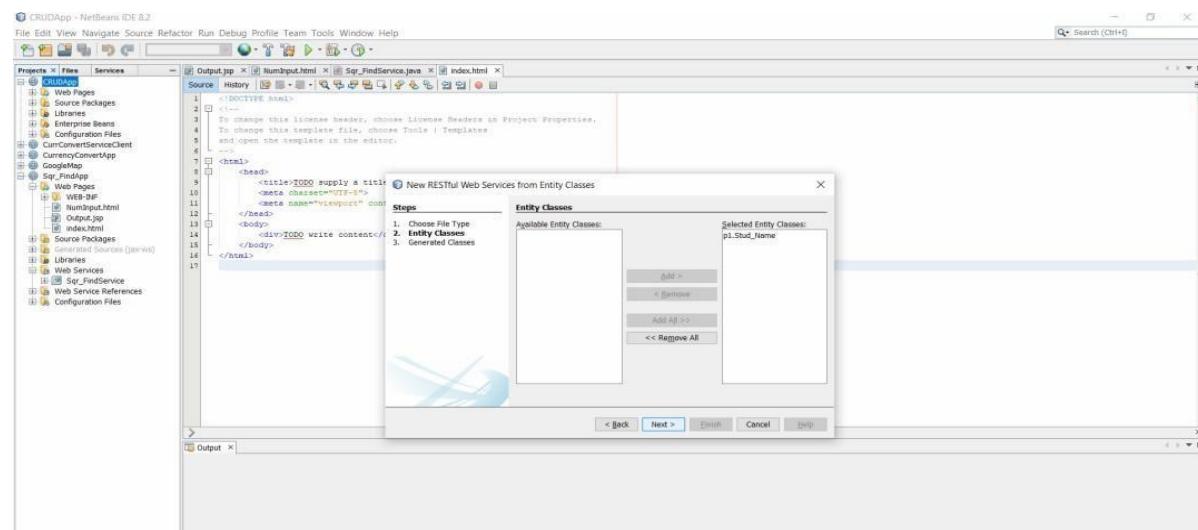

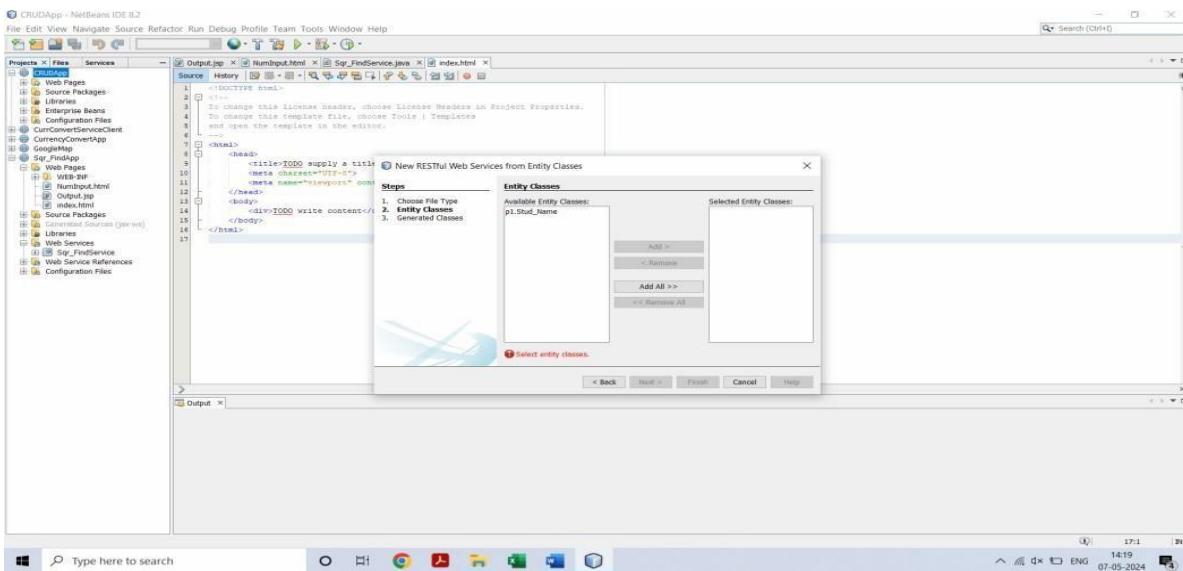

**11. Now click on Finish.**

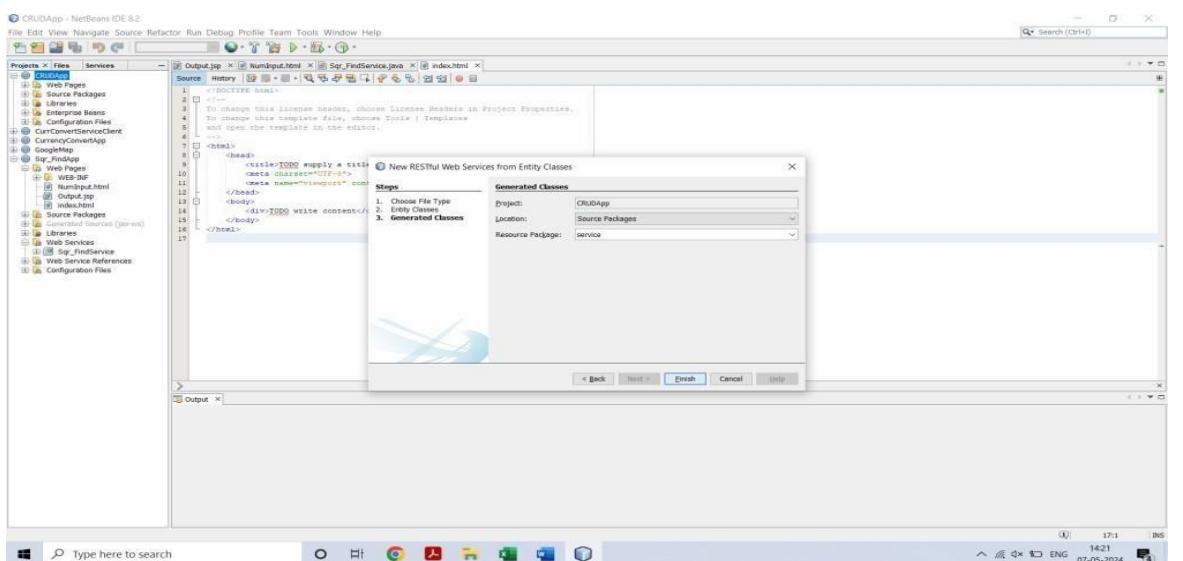

**12. Right click on project name and create RESTful Web Services from Entity Classes.**

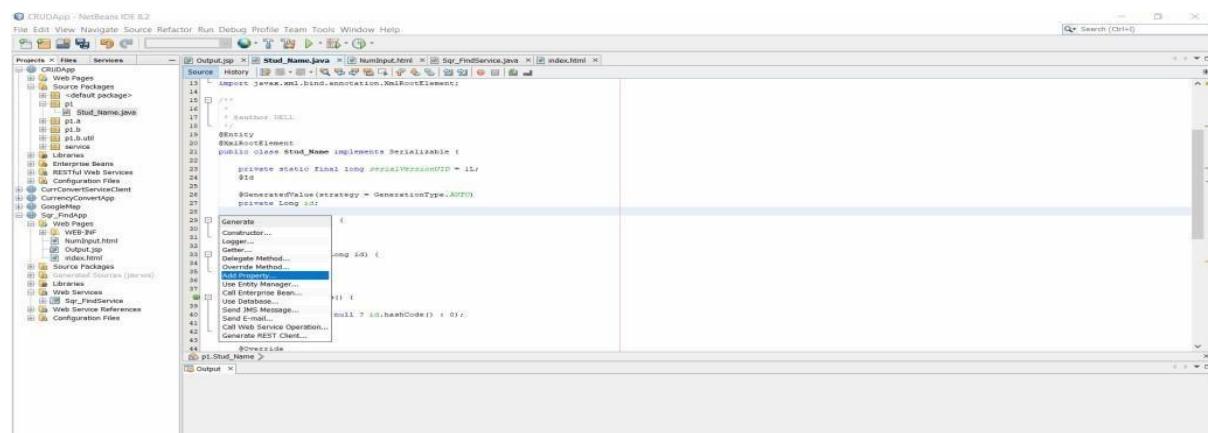

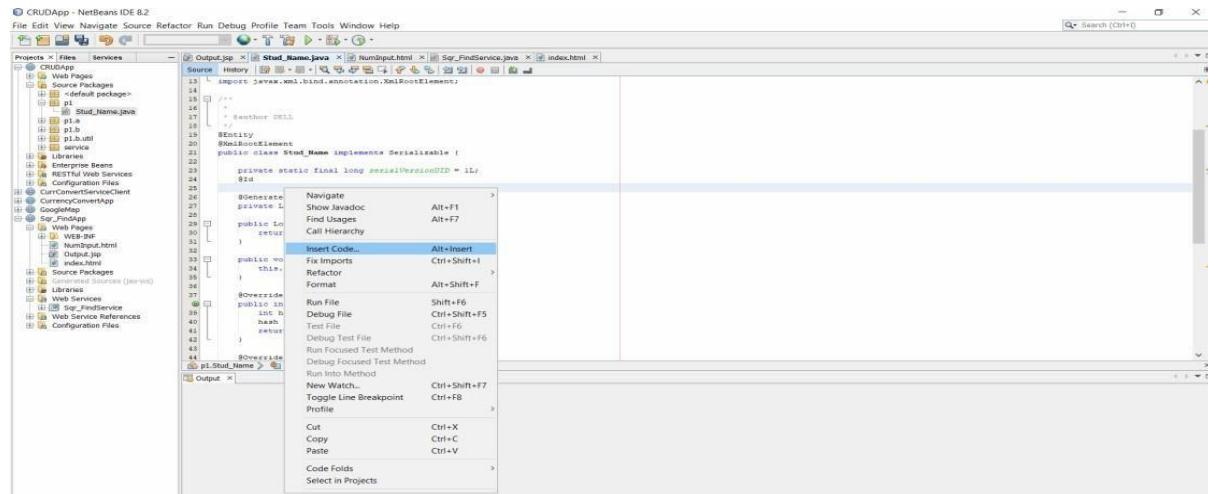

**13. Repeat step 9 and then it will go on next page. Then enter the p1.service in Resource Package and then click on Finish button.**

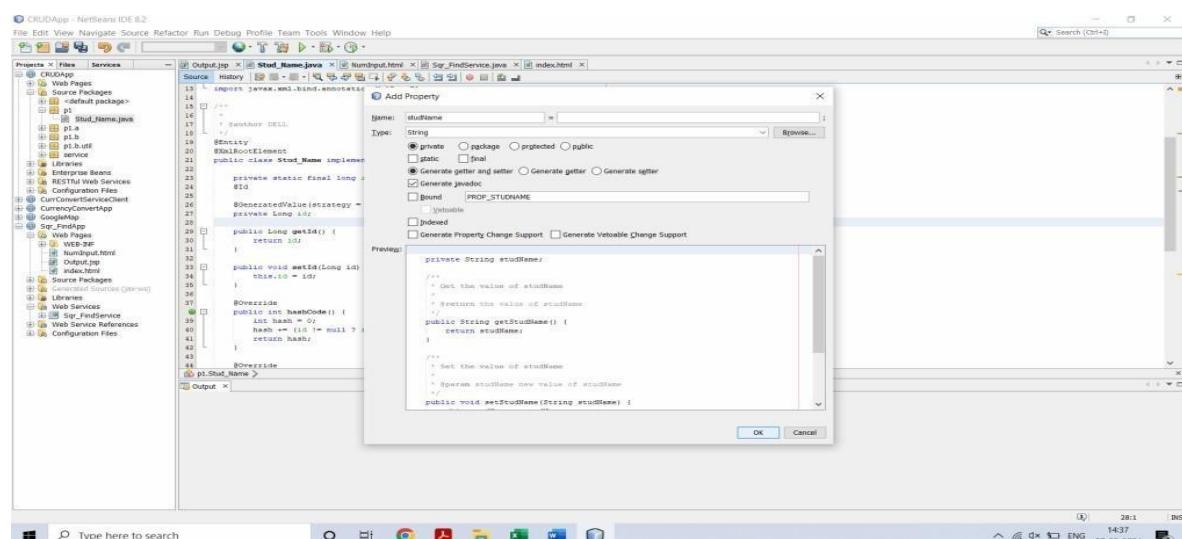

14. Now open Stud\_Name.java file under p1 package.

15. In this file at line number 24, do the right click and select Insert Code.

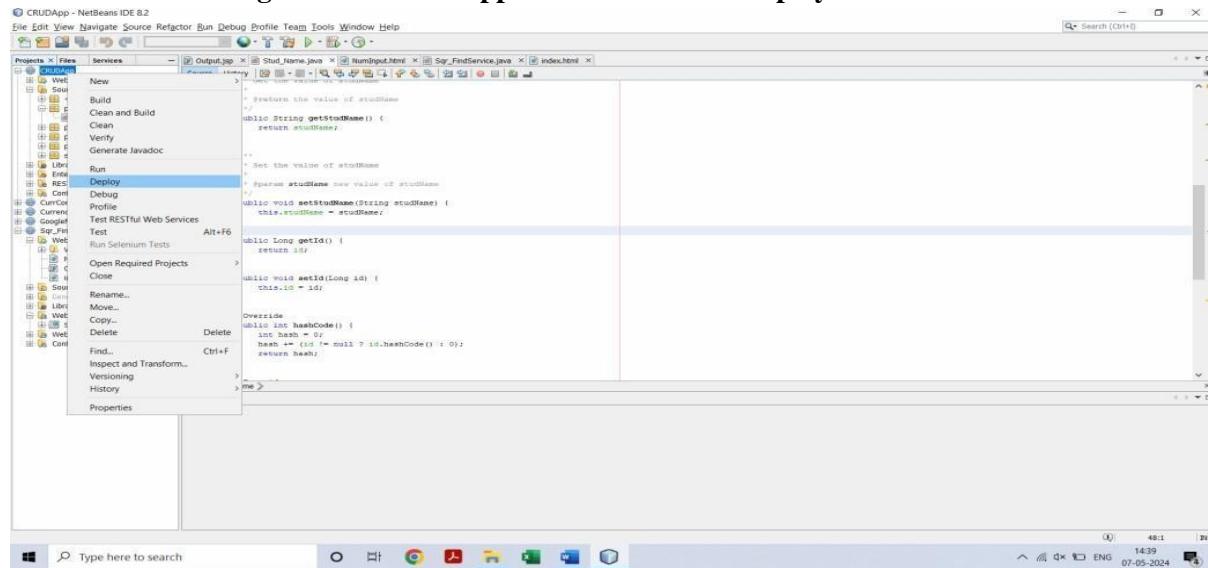

16. A new list will appear. Click on Add Property

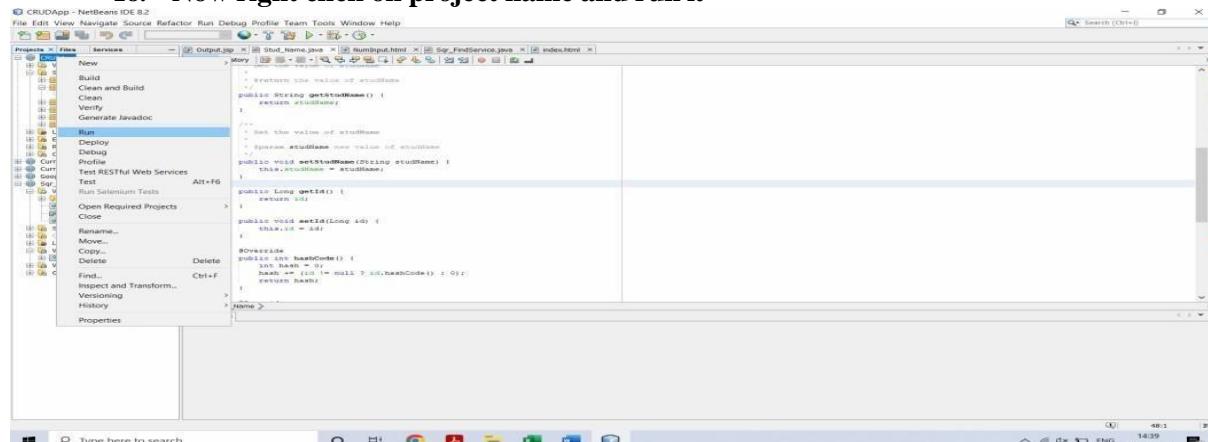

A new window will open. Enter name as studName. Make sure name should be exact same as of mine and then click on OK button. Actually we are setting getter and setter method for studName.

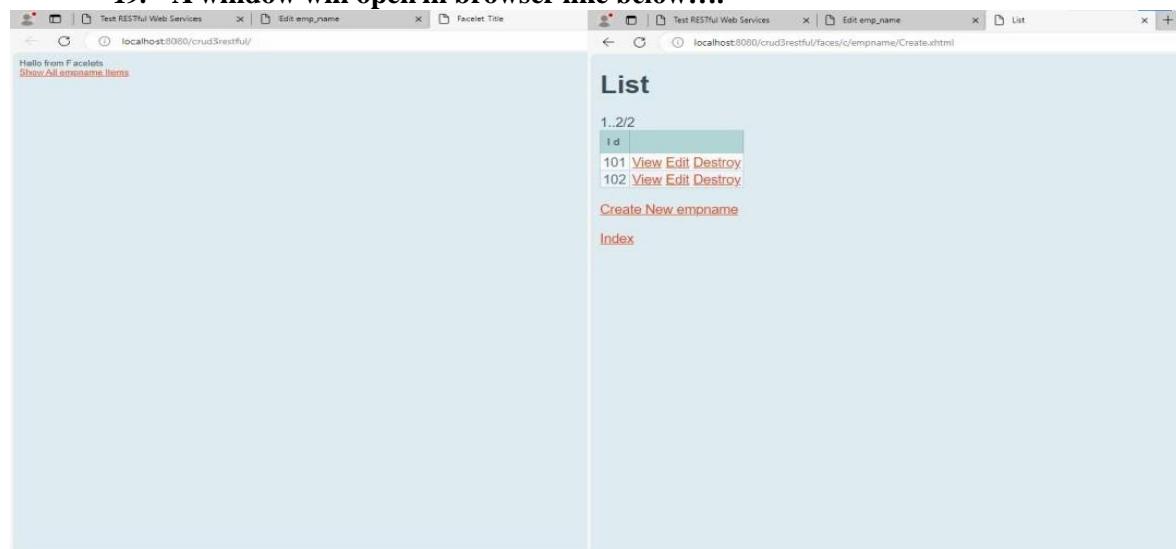

**17. Now right click on web application name and Deploy it.**

**18. Now right click on project name and run it**

**19. A window will open in browser like below....**

## Practical - 4

### Develop application to consume Google's search / Google's Map RESTful Web service.

- Develop application to consume Google's search / Google's Map RESTful Web service.
- 1. First of all we need to create an Java Web Application with any name, let it be GoogleMap here using Netbeans IDE.
- 2. The code inside the input.jsp will be similar to this input.jsp Input.jsp

```
<%@page contentType="text/html" pageEncoding="UTF-8"%>
<!DOCTYPE html>
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
<title>JSP Page</title>
</head>
<body>
<form action="index.jsp">
<pre>
    Enter latitude:<input type="text" name="t1" />
    Enter longitude:<input type="text" name="t2" />
    <input type="submit"
        value="Show" /> </pre>
</form>
</body>
</html>
```

3. Before running the application we need the Google API key. The steps are shown here: - Visit Google APIs Console (<https://console.developers.google.com/apis/dashboard?project=eminent-kit-237101>, you have to login with your Google account).

The screenshot shows the Google APIs Console dashboard. At the top, there are several tabs: https://mahad, New announce, M. Sc CS 2018, syllabus\_msc\_i, and Java Web S. Below the tabs, the URL https://console.developers.google.com/apis/dashboard?project=eminent-kit-237101 is displayed. The main interface has a sidebar on the left with icons for APIs, Services, and Google Cloud. The main area is titled "APIs & Services" with a "ENABLE APIs AND SERVICES" button. It displays two sections: "Traffic" and "Errors". The "Traffic" section shows a graph with a single data point at 0.001/s. The "Errors" section lists several error entries, each with a timestamp and a short description.

- Create a new API Project.

The screenshot shows a "Select a project" dialog box. At the top, it says "Select a project" and has a "NEW PROJECT" button. Below that is a search bar labeled "Search projects and folders". The main area is divided into "RECENT" and "ALL" sections. Under "RECENT", there are three projects listed: "GoogleMap" (selected, indicated by a checkmark), "Practical6", and "My Project". Under "ALL", there is a single entry: "eminent-kit-237101". At the bottom right of the dialog are "CANCEL" and "OPEN" buttons.

- Enter the name to your project.

You have 7 projects remaining in your quota. Request an increase or delete projects. [Learn more](#)

[MANAGE QUOTAS](#)

Project name \*

Project ID: zeta-environs-237517. It cannot be changed later. [EDIT](#)

Location \*  [BROWSE](#)

Parent organization or folder

[CREATE](#) [CANCEL](#)

- Enable the Google Maps API V3.

Maps JavaScript API

Google

Maps for your website

[MANAGE](#) API enabled

Type APIs & services	<b>Overview</b>
Last updated 1/10/19, 2:02 AM	Add a map to your website, providing imagery and local data from the same source as Google Maps. Style the map to suit your needs. Visualize your own data on the map, bring the world to life with Street View, and use services like geocoding and directions.
Category Maps	<b>About Google</b>
Service name maps-backend.googleapis.com	Google's mission is to organize the world's information and make it universally accessible and useful. Through products and platforms like Search, Maps, Gmail, Android, Google Play, Chrome and YouTube, Google plays a meaningful role in the daily lives of billions of people.
<b>Tutorials and documentation</b>	

4. Create another file index.jsp

## Index.jsp

```
<%@page contentType="text/html" pageEncoding="UTF-8"%>
```

```
<!DOCTYPE html>
```

```
<html>
```

```
<head>
```

```
<meta charset="UTF-8">
```

```
<title>Google Maps</title>
```

```
<style>
#map {
    height: 400px;
    width: 100%;
}

</style>

</head>

<body>
<%
    double lati = Double.parseDouble(request.getParameter("t1"));
    double longi = Double.parseDouble(request.getParameter("t2"));
%>

<h3>Google Maps</h3>
<div id="map"></div>

<script lang="javascript">
function initMap() {
    var info = { lat: <%= lati %>, lng: <%= longi %> };

    var map = new google.maps.Map(document.getElementById('map'), {
        zoom: 4,
        center: info
    });

    var marker = new google.maps.Marker({
        position: info,
        map: map
    });
}
</script>
```

```
<script async defer  
src="https://maps.googleapis.com/maps/api/js?key=YOUR_API_KEY&callback=initMap"></script>  
</body>
```

## Output :-

A screenshot of a web browser window titled "JSP Page". The URL is "http://localhost:8080/WebApplication1/newjsp.jsp". The page contains two text input fields: "Enter latitude:" followed by "19.0269" and "Enter longitude:" followed by "72.8553". Below these fields is a "Show" button.

```
</html>
```

## Practical - 5

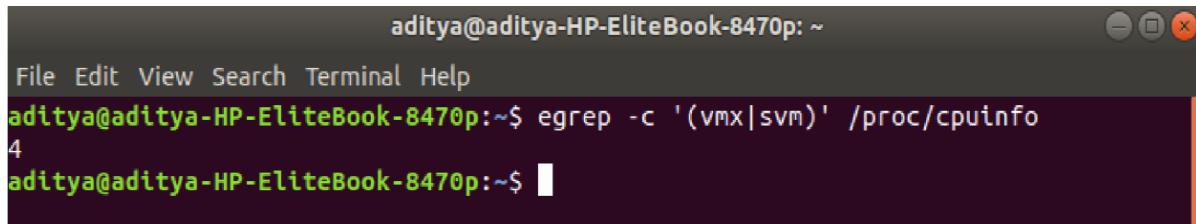

### Installation and Configuration of virtualization using KVM.

#### Steps to install Virtualization using KVM

To create a virtual machine first we need to ensure that virtualization is enabled on our system. It is mandatory to create virtual machines. There are multiple ways to check if virtualization is enabled,

```
$ egrep -c '(vmx|svm)' /proc/cpuinfo
```

The above command /proc/cpuinfo gives information about the processor. The output of the command will be a number. The output number 1 or more than that represents that virtualization is enabled, output 0 says you need to enable virtualization on your system.

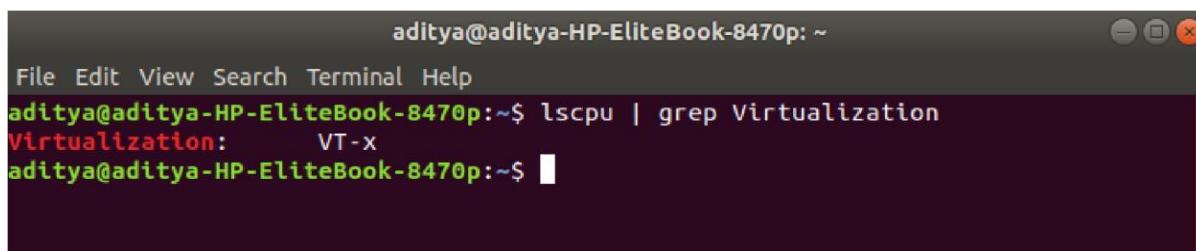

```
aditya@aditya-HP-EliteBook-8470p: ~
File Edit View Search Terminal Help
aditya@aditya-HP-EliteBook-8470p:~$ egrep -c '(vmx|svm)' /proc/cpuinfo
4
aditya@aditya-HP-EliteBook-8470p:~$
```

A screenshot of a terminal window titled "aditya@aditya-HP-EliteBook-8470p: ~". The window has standard Linux-style window controls at the top right. The terminal itself is dark-themed. The user has run the command "egrep -c '(vmx|svm)' /proc/cpuinfo" and the output is displayed in green text: "4". The prompt "aditya@aditya-HP-EliteBook-8470p:~\$" is visible at the bottom.

#### Virtualization Inability \$ lscpu | grep Virtualization

This command is used to check which type of virtualization your processor supports. If the system contains a CPU with Intel VT support, the above command will provide the following output

```
aditya@aditya-HP-EliteBook-8470p: ~
File Edit View Search Terminal Help
aditya@aditya-HP-EliteBook-8470p:~$ lscpu | grep Virtualization
Virtualization: VT-x
aditya@aditya-HP-EliteBook-8470p:~$
```

A screenshot of a terminal window titled "aditya@aditya-HP-EliteBook-8470p: ~". The window has standard Linux-style window controls at the top right. The terminal is dark-themed. The user has run the command "lscpu | grep Virtualization" and the output is displayed in green text: "Virtualization: VT-x". The prompt "aditya@aditya-HP-EliteBook-8470p:~\$" is visible at the bottom.

#### Virtualization Type

Installing KVM on Ubuntu

```
$ sudo apt-get install virt-manager
```

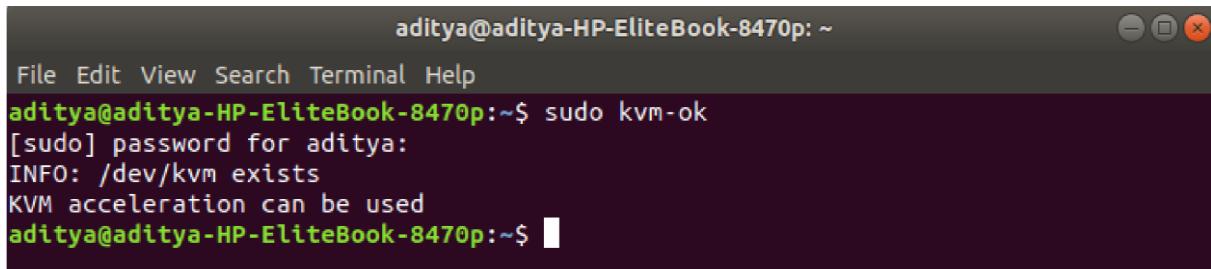

Now we know our system is capable of creating and running virtual machines, it's time to install tools which will create our virtual machines. To install KVM and other KVM dependencies such as virt-manager, bridge-utils enter command:

```
$ sudo apt -y install bridge-utils cpu-checker libvirt-clients libvirt-daemon qemu
qemu-kvm
```

1. bridge-utils: The bridge-utils package contains a utility needed to create and manage bridge devices. This is useful in setting up networks for a hosted virtual machine (VM).
2. cpu-checker: Outputs the specifications of CPU

3. libvirt-clients: a toolkit to manage virtualization platforms/clients and hypervisors
4. qemu: A program that can run the operating system of the machine on different machines
5. qemu-kvm: Runs process using KVM module

All dependencies are installed now run command its time to check if KVM ins installed successfully: \$ sudo kvm-ok

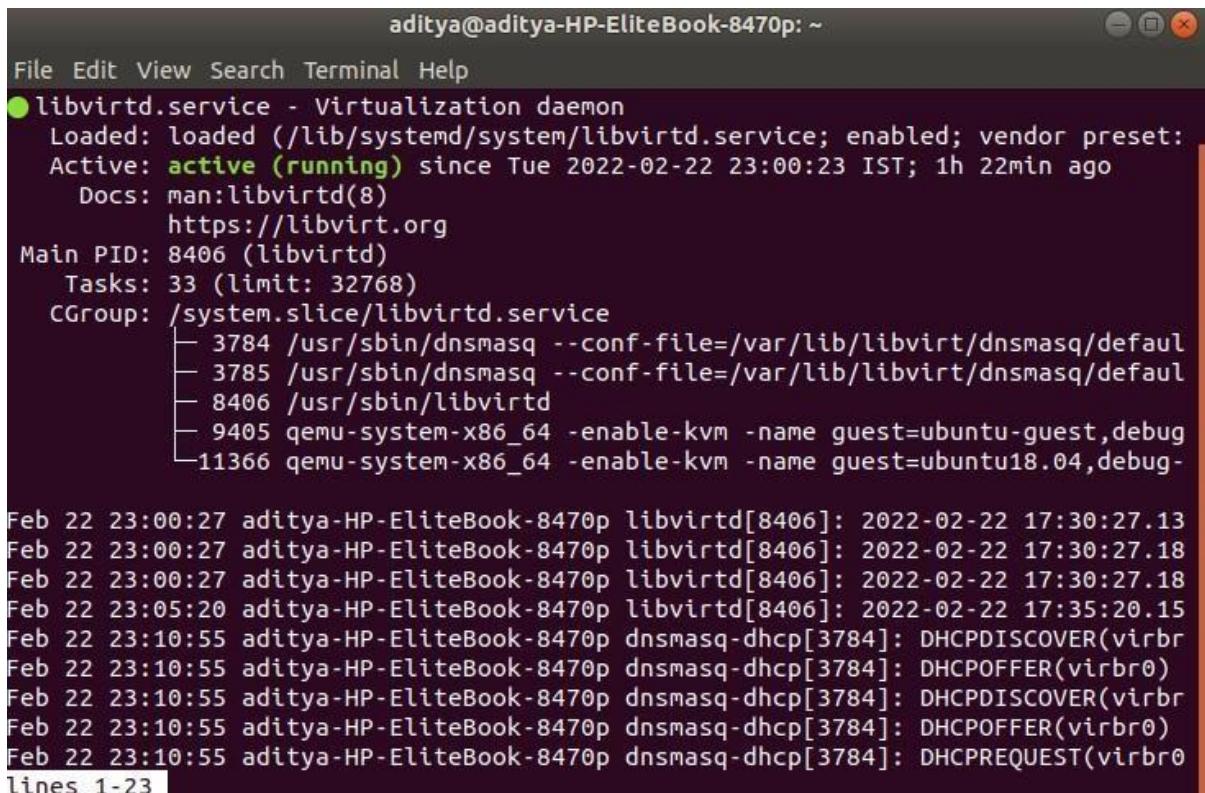

```
aditya@aditya-HP-EliteBook-8470p: ~
File Edit View Search Terminal Help
aditya@aditya-HP-EliteBook-8470p:~$ sudo kvm-ok
[sudo] password for aditya:
INFO: /dev/kvm exists
KVM acceleration can be used
aditya@aditya-HP-EliteBook-8470p:~$
```

### Check if KVM is Installed properly

Also, we need to confirm if the virtualization daemon – libvirdt-daemon – is running, to do so enter the command.

\$ sudo systemctl status libvirtd

If the output is not active: running you need to start daemon thread

```
aditya@aditya-HP-EliteBook-8470p: ~
File Edit View Search Terminal Help
● libvirdt.service - Virtualization daemon
   Loaded: loaded (/lib/systemd/system/libvirdt.service; enabled; vendor preset: enabled)
   Active: active (running) since Tue 2022-02-22 23:00:23 IST; 1h 22min ago

Feb 22 23:10:55 aditya-HP-EliteBook-8470p dnsmasq-dhcp[3784]: DHCPOFFER(virbr0)
Feb 22 23:10:55 aditya-HP-EliteBook-8470p dnsmasq-dhcp[3784]: DHCPREQUEST(virbr0)
lines 1-23
```

If the daemon thread is not running enter the following command to start the thread,

\$ sudo systemctl enable –now libvirdt

Adding a user to KVM

In this part, we are going to create a user for KVM. To prevent root user from using KVM and root user is only available when root user is a part of libvirt/libvird group. To add a new user to KVM, use the following command,

**sudo adduser [username] libvirdt**

[username] enter the username of your choice if the output is

```
aditya@aditya-HP-EliteBook-8470p: ~
File Edit View Search Terminal Help
aditya@aditya-HP-EliteBook-8470p:~$ sudo adduser aditya libvirdt
[sudo] password for aditya:
adduser: The group 'libvirdt' does not exist.
aditya@aditya-HP-EliteBook-8470p:~$
```

## Adding User to KVM

If your KVM is already a member of the non-root user and serves the same purpose as libvirdt group then you don't need to add yourself to the group.

### Creating Virtual Machine

There are two ways to create a virtual machine

1. Using the command line
2. Using the graphical interface
- **Create a Virtual Machine via Command Line**

virt-install is a command which is used to create virtual machines in Linux, following is the command which creates a VM.

**sudo virt-install –name=ubuntu-guest –os-variant=ubuntu20.04 –vcpu=2 –ram=2048 –graphics none –location=[local path to iso file] –network bridge:vibr0**

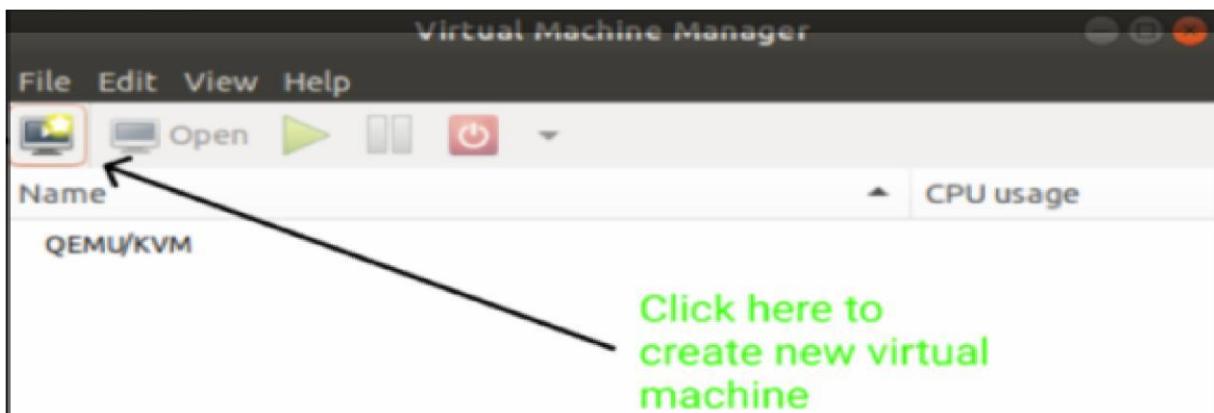

The above command creates a Ubuntu virtual machine with version 20.04 and the name ubuntu-guest.

1. Name: specify the name of the virtual machine being created
2. vcpu: Number of virtual CPUs to configure for the guest.
3. Ram: Memory to allocate for guest instance in megabytes. According to your machine, you can specify the given memory of the VM.
4. Graphics spice: If no graphics option is specified, “virt-install” will default to ‘–graphics vnc’ if the display environment variable is set, otherwise ‘–graphics none’ is used.
5. Location: location of iso file on which virtual machine will be built. It can be the path to an ISO image, or to a CDROM device. It can also be a URL from which to fetch/access a minimal boot ISO image.
6. Network-bridge: Connect the guest to the host network, Connect to a bridge device in the host called “BRIDGE”.

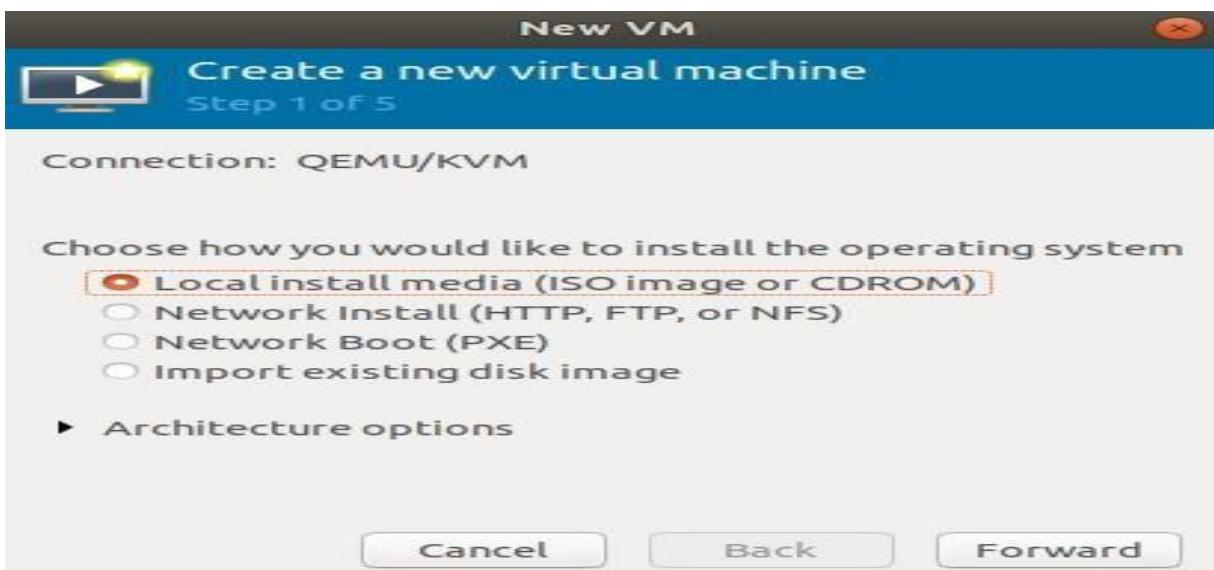

### Create a Virtual machine using a graphical interface

If you are not much familiar with the command line don't worry there's another way to create a virtual machine using a tool called virt-manager you can easily create virtual machines.

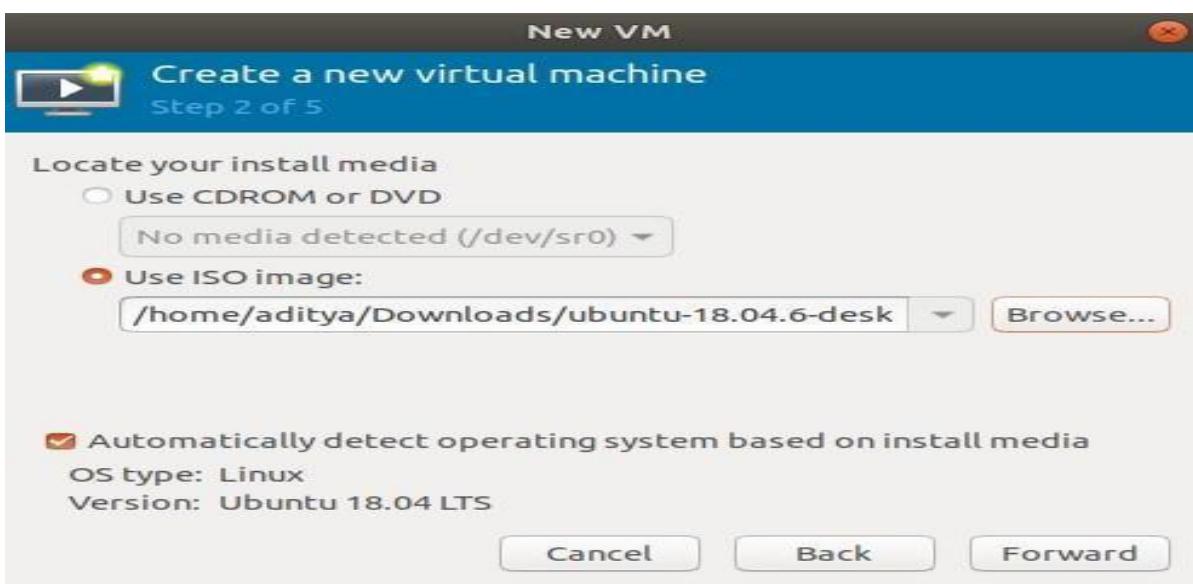

Steps to create VM using virt-manager,

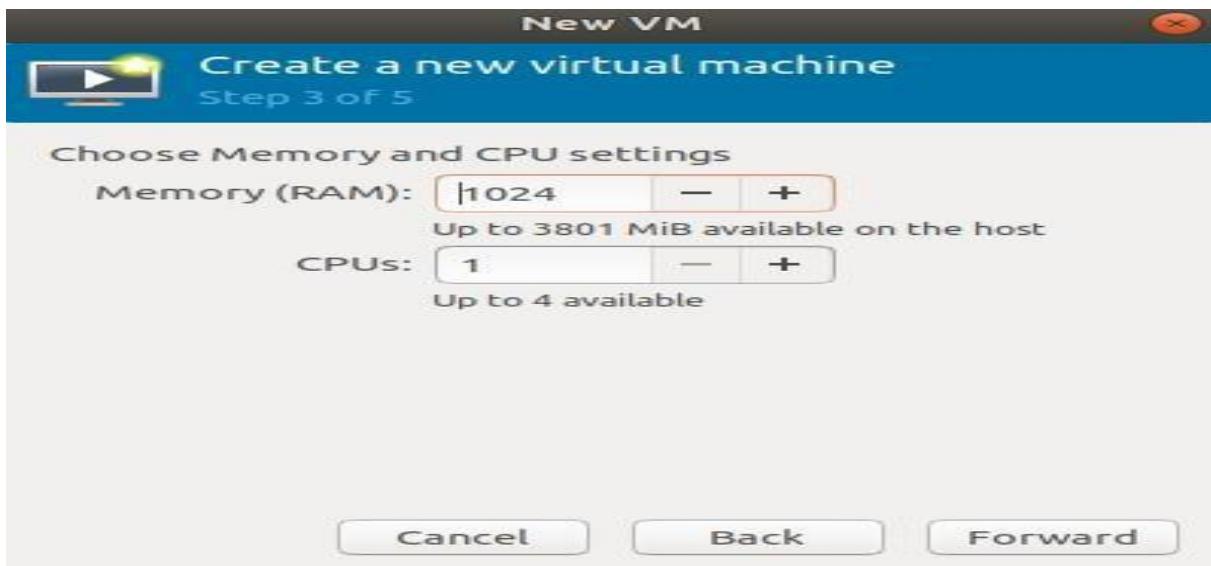

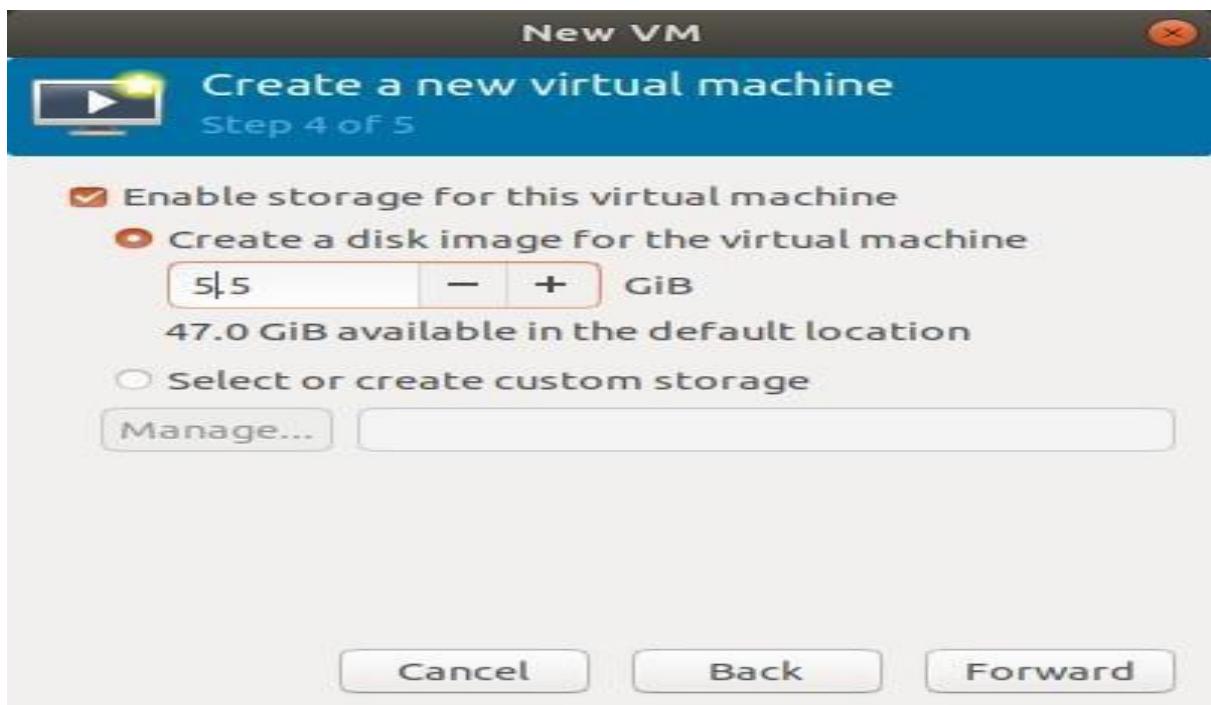

**Step 1:** Launch virt-manager

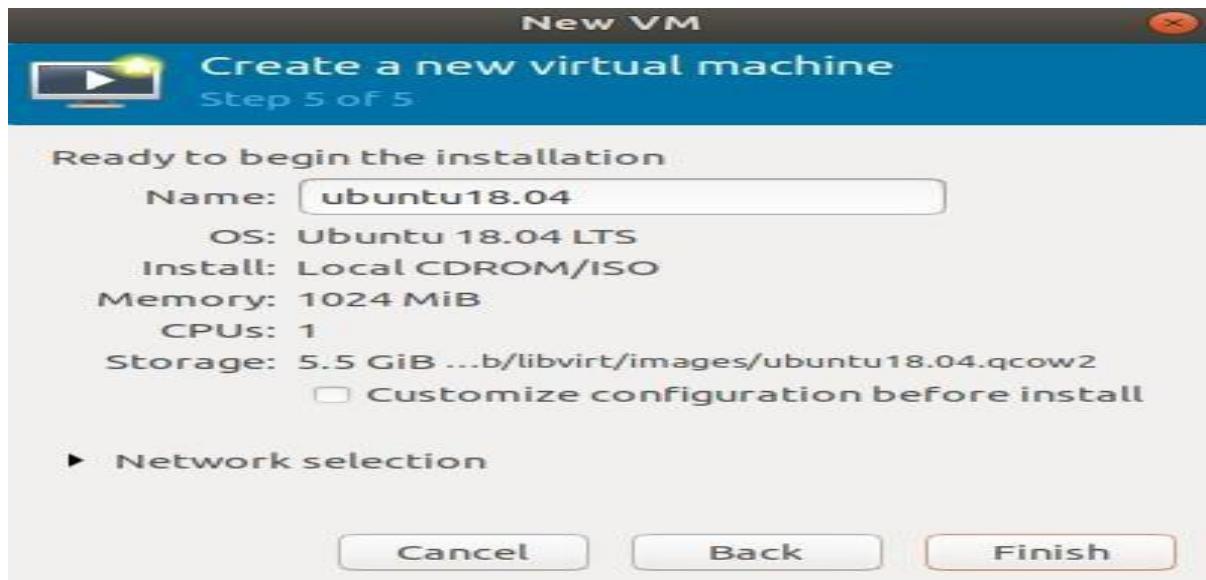

**Step 2:** Choose installation media it can be an iso file of OS, you can install from the network or can be a disk copy

**Step 3:** Enter the path/URL of your file click next

**Step 4:** Enter memory and CPU requirements**Step 5:** Enter required disk space**Step 6:** Enter the name of VM and check specifications and hit the finish

Now the installations should be completed and the virtual machine should start running.

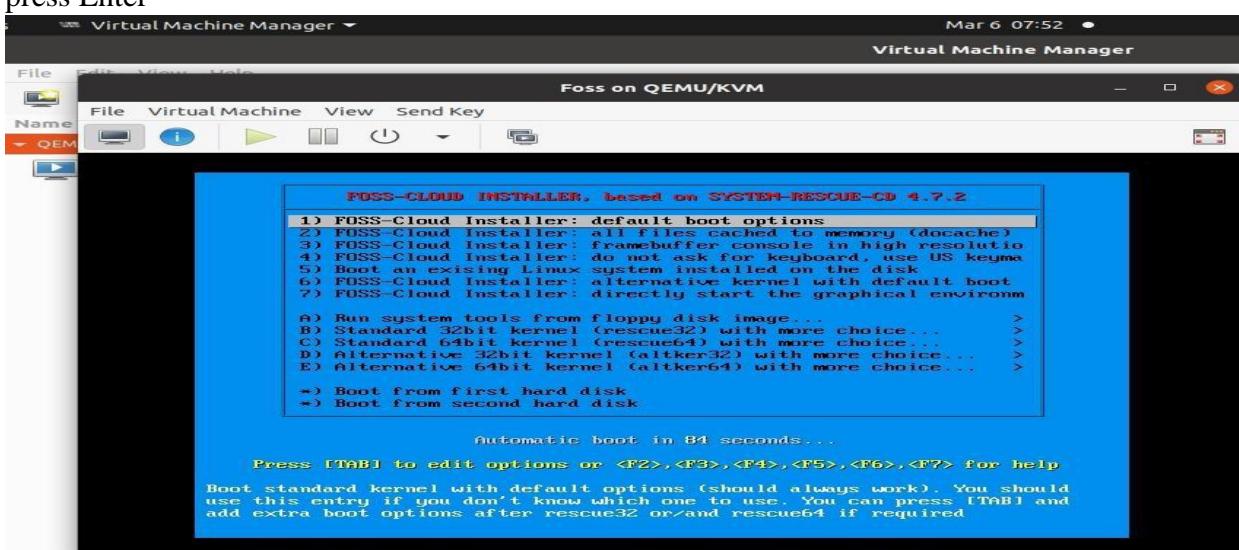

**Conclusion:** Hence we have successfully installed and Configured virtualization using KVM.

## Practical - 6

### Implement FOSS-Cloud Functionality VSI (Virtual Server Infrastructure) Infrastructure as a Service (IaaS), Creating Virtual Machine or Storage

**Steps:**

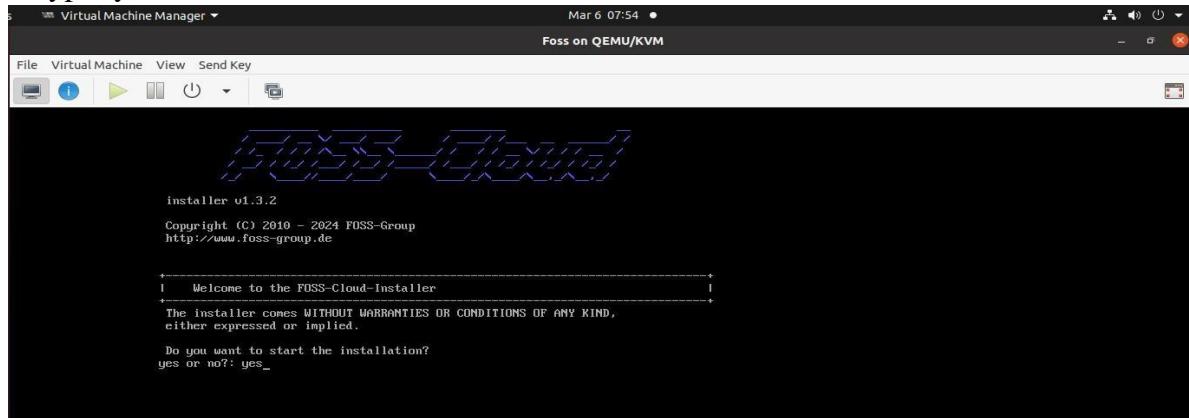

1. Start VMWARE workstation player 15 → select Open virtual machine then → Browse a foss cloud iso file → then select Operating System: Other Version: Other, Name: FOSS.
2. Then click on edit virtual machine and select Processor: 2 or 3, Memory: expand to 165 GM.
3. Once the foss Cloud is launched select “Foss-Cloud installer :default boot options” and press Enter

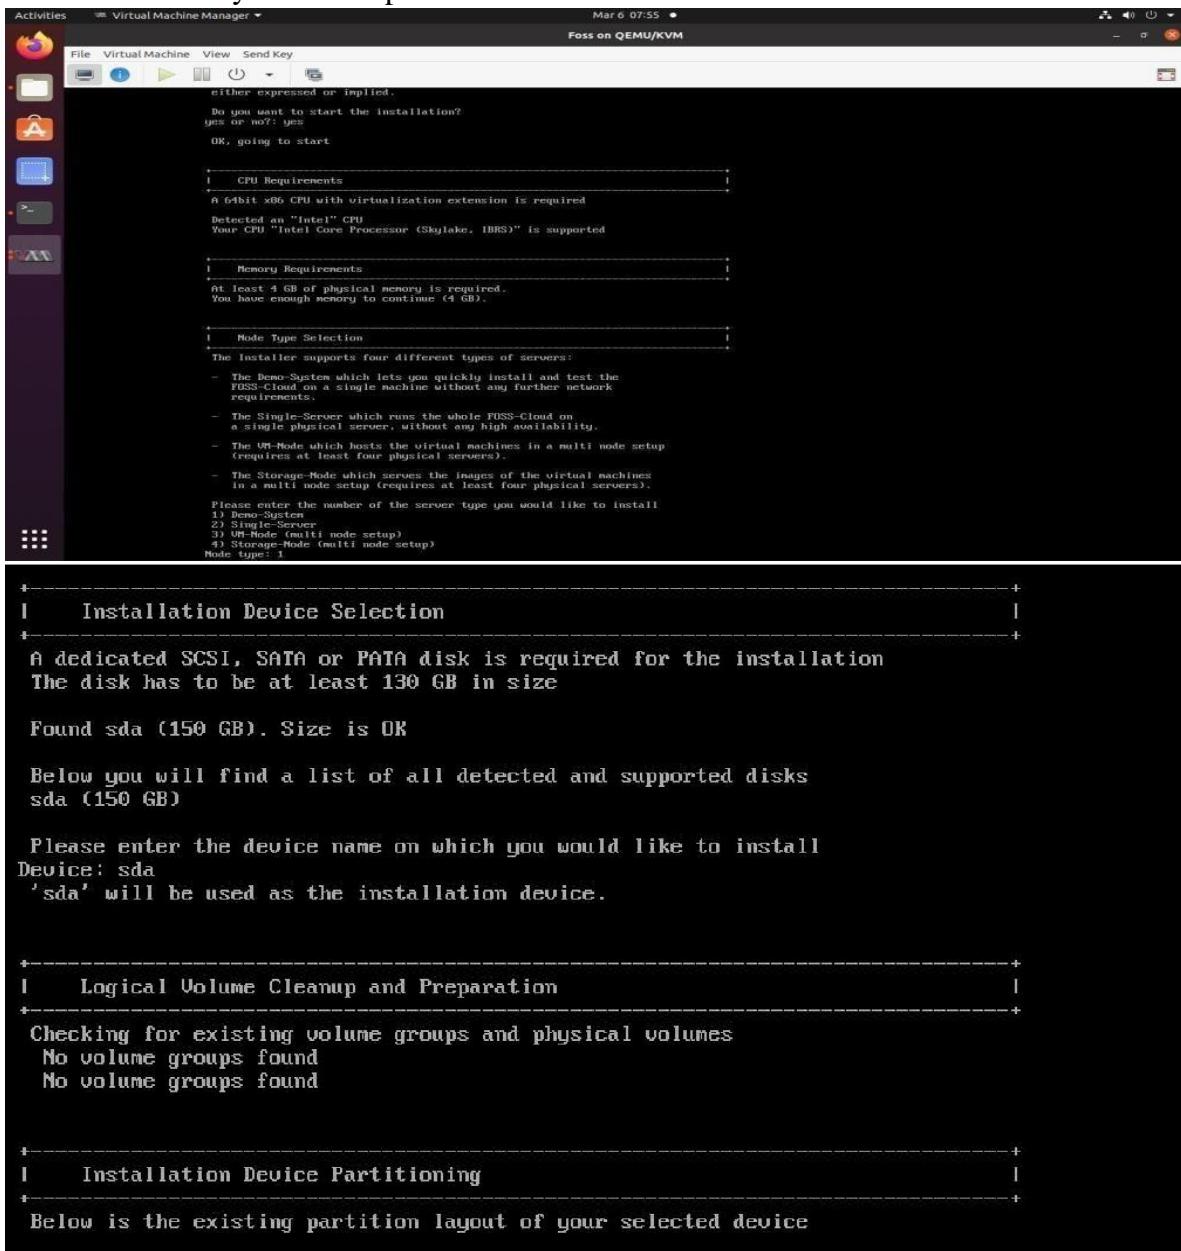

4. Reboot your system and select foss cloud

5. Types yes to start the installation

6. Select “Demo System” and press Enter

7. Enter the Device name as “sda” and press enter

8. Put credential of foss cloud and start foss cloud

```

Mar 6 08:02 •
Foss on QEMU/KVM

Logical Volume Setup
Setup LVM environment and volumes
Filesystem creation
Volume group "focal0" successfully created
Logical volume "home" created
Logical volume "var" created
Logical volume "tmp" created
Logical volume "portage" created
Logical volume "virtualization" created
All LVM volumes created successfully.

Filesystem Creation
Creating filesystems
mke2fs 1.42.13 (17-May-2015)
Filesystem creation was successful

Mounting Filesystems
Mounting of filesystems was successful

Stage4 Installation
Unpacking staged tarball
This will take a while - please be patient
Unpacking of staged tarball was successful

Network Device Selection
Please enter the device which you would like to use
Available ethernet devices: ens3
Device #0:

*****

12. After putting the login details you will get the below mention page

The screenshot shows the FOSS-Cloud web application running at [192.168.73.129/vm-manager/site](http://192.168.73.129/vm-manager/site). The page has a light beige background. At the top right is a language dropdown set to "EN". On the far right, there's a "Logout (admin)" link. The main content area features a large red logo for "FOSS Cloud" on the left. To its right is a sidebar with navigation links: "Virtual Machine", "VM Pool", "Storage Pool", "Node", "Network", "User", "Configuration", "Diagnostics", and "Assigned VMs". Below the sidebar, the text "Welcome to the FOSS-Cloud" is displayed, followed by a paragraph about the project's purpose and a "Donate" button. Further down, there's a "Links" section with links to "Documentation" and "Spice-Client (with protocol handler) download". At the bottom of the page, there's a footer with copyright information: "Version 1.3.2 on server localhost Copyright © 2025 by FOSS-Group. All Rights Reserved."

## Practical - 7

**Using AWS Flow Framework develop application that includes a simple workflow. Workflow calls an activity to print hello world to the console. It must define the basic usage of AWS Flow Framework, including defining contracts, implementation of activities and workflow coordination logic and worker programs to host them.**

**Step 1: Open Terminal and Update and Upgrade your system by**

**command sudo apt-get update && sudo apt-get upgrade**

```
root@lab-Vostro-3268:/home/lab# apt-get update && apt-get upgrade
Get:1 http://in.archive.ubuntu.com/ubuntu focal InRelease [114 kB]
Get:2 http://in.archive.ubuntu.com/ubuntu focal-updates InRelease [114 kB]

/usr/lib/python3/dist-packages/paramiko/transport.py:220: CryptographyDeprecationWarning: Blowfish has been deprecated and will be removed in
a future release
  "class": algorithms.Blowfish,
You can preselect a particular runtime or package type when using the `sam init` experience.
Call `sam init --help` to learn more.

Which template source would you like to use?
  1 - AWS Quick Start Templates
  2 - Custom Template Location
Choice: 1
```

**Step 8: Select Template no.1 Hello World Example**

```
Choose an AWS Quick Start application template
  1 - Hello World Example
  2 - Data processing
  3 - Hello World Example with Powertools for AWS Lambda
  4 - Multi-step workflow
  5 - Scheduled task
  6 - Standalone function
  7 - Serverless API
  8 - Infrastructure event management
  9 - Lambda Response Streaming
 10 - Serverless Connector Hello World Example
 11 - Multi-step workflow with Connectors
 12 - GraphQL API Hello World Example
 13 - Full Stack
 14 - Lambda EFS example
 15 - Hello World Example With Powertools for AWS Lambda
 16 - DynamoDB Example
 17 - Machine Learning
Template: 1
```

**Step 9: Type “N” if it ask to use most popular runtime and package type**

**Open new terminal by pressing ctrl+shift+T and check for python version by command python –version**

**Select the option according to your python version in my case its option 19- python 3.11**

```
use the most popular runtime and package type? (Python and zip) [y/N]: n

Which runtime would you like to use?
  1 - aot.dotnet7 (provided.al2)
  2 - dotnet8
  3 - dotnet6
  4 - go1.X
  5 - go (provided.al2)
  6 - go (provided.al2023)
  7 - graalvm.java11 (provided.al2)
  8 - graalvm.java17 (provided.al2)
  9 - java21
 10 - java17
 11 - java11
 12 - java8.al2
 13 - nodejs20.x
 14 - nodejs18.x
 15 - nodejs16.x
 16 - python3.9
 17 - python3.8
 18 - python3.12
 19 - python3.11
 20 - python3.10
 21 - ruby3.2
 22 - rust (provided.al2)
 23 - rust (provided.al2023)

Runtime: 17
```

### Step 10: Select package type as Zip

```
What package type would you like to use?
  1 - Zip
  2 - Image
Package type: 1
```

### Step 11: Now choose Yes option everytime it ask .

#### Give project name as per your preference in my case its sam-app-test

```
Based on your selections, the only dependency manager available is pip.
We will proceed copying the template using pip.

Would you like to enable X-Ray tracing on the function(s) in your application? [y/N]: y
X-Ray will incur an additional cost. View https://aws.amazon.com/xray/pricing/ for more details

Would you like to enable monitoring using CloudWatch Application Insights?
For more info, please view https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/cloudwatch-application-insights.html [y/N]: y
AppInsights monitoring may incur additional cost. View https://docs.aws.amazon.com/AmazonCloudWatch/latest/monitoring/appinsights-what-is.html
#appinsights-pricing for more details

Would you like to set Structured Logging in JSON format on your Lambda functions? [y/N]: y
Structured Logging in JSON format might incur an additional cost. View https://docs.aws.amazon.com/lambda/latest/dg/monitoring-cloudwatchlogs.html#monitoring-cloudwatchlogs-pricing for more details

Project name [sam-app]: sam-app-test
Cloning from https://github.com/aws/aws-sam-cli-app-templates (process may take a moment)

-----
Generating application:
-----
Name: sam-app-test
Runtime: python3.8
Architectures: x86_64
Dependency Manager: pip
Application Template: hello-world
Output Directory: .
Configuration file: sam-app-test/samconfig.toml

Next steps can be found in the README file at sam-app-test/README.md
```

**Step 12: Now one folder will be created by your provided project name go into that folder by command cd (folder name)**

**After entering the project folder we will invoke the HelloWorldFunction by using commands sam local invoke „HelloWorldFunction“**

```
root@lab-Vostro-3268:/home/lab/sam-app-test# sam local invoke 'HelloWorldFunction'

**Output:**

## Practical - 8

### Implementation of Openstack with user and private network creation.

**THEORY:** OpenStack is a cloud OS that is used to control the large pools of computing, storage, and networking resources within a data center. Open Stack is open-source and free software. This is basically used for cloud computing and deployed as an IaaS.

## Components of OpenStack

Major components of OpenStack are given below:

**Compute (Nova):** Compute is a controller that is used to manage resources in virtualized environments. It handles several virtual machines and other instances that perform computing tasks.

**Object Storage (Swift):** To store and retrieve arbitrary data in the cloud, object storage is used. In Swift, it is possible to store the files, objects, backups, images, videos, virtual machines, and other unstructured data. Developers may use a special identifier for referring the file and objects in place of the path, which directly points to a file and allows OpenStack to manage where to store the files.

**Block Storage (Cinder):** This works in the traditional way of attaching and detaching an external hard drive to the OS for its local use. Cinder manages to add, remove, create new disk space in the server. This component provides the virtual storage for the virtual machines in the system.

**Networking (Neutron):** This component is used for networking in OpenStack. Neutron manages all the network-related queries, such as IP address management, routers, subnets, firewalls, VPNs, etc. It confirms that all the other components are well connected with OpenStack.

**Dashboard (Horizon):** This is the first component that the user sees in the OpenStack. Horizon is the web UI (user interface) component used to access the other back-end services.

Through individual API (Application programming interface), developers can access the OpenStack's components, but through the dashboard, system administrators can look at what is going on in the cloud and manage it as per their need.

**Identity Service (Keystone):** It is the central repository of all the users and their permissions for the OpenStack services they use. This component is used to manage identity services like authorization, authentication, AWS Styles (Amazon Web Services) logins, token-based systems, and checking the other credentials (username & password).

**Image Service (Glance):** The glance component is used to provide the image services to OpenStack. Here, image service means the images or virtual copies of hard disks. When we plan to deploy a new virtual machine instance, then glance allows us to use these images as templates. Glance allows virtual box (VDI), VMware (VMDK, OVF), Raw, Hyper-V (VHD) and KVM (qcow2) virtual images.

### STEPS:

#### Step 1: Update Ubuntu System

Open the terminal and run the following command to ensure that the system is up to date :

```
$ sudo apt update OR
```

```
$ sudo apt -y upgrade Sample
```

### Output :

```
nikita@JTP:~$ sudo apt update
[sudo] password for nikita:
Hit:1 http://in.archive.ubuntu.com/ubuntu bionic InRelease
Get:2 http://in.archive.ubuntu.com/ubuntu bionic-updates InRelease [88.7 kB]
Get:3 http://security.ubuntu.com/ubuntu bionic-security InRelease [88.7 kB]
Get:4 http://in.archive.ubuntu.com/ubuntu bionic-backports InRelease [74.6 kB]
Get:5 http://apt.puppetlabs.com trusty InRelease [132 kB]
Get:6 http://in.archive.ubuntu.com/ubuntu bionic-updates/main amd64 Packages [1,726 kB]
Get:7 http://security.ubuntu.com/ubuntu bionic-security/main i386 Packages [847 kB]
Get:8 http://in.archive.ubuntu.com/ubuntu bionic-updates/main i386 Packages [1,142 kB]
Get:9 http://in.archive.ubuntu.com/ubuntu bionic-updates/main Translation-en [367 kB]
Get:10 http://security.ubuntu.com/ubuntu bionic-security/main amd64 Packages [1,400 kB]
Get:11 http://in.archive.ubuntu.com/ubuntu bionic-updates/main amd64 DEP-11 Metadata [294 kB]
```

Reboot the system after running the above command. To reboot the system, run the following command :

```
$ sudo reboot or
$ init 6
```

## Step 2: Create Stack User

It is important that the devstack must run as a regular user (non-root user) with the sudo enabled.

To keep this note in mind, let's create a new user with the name "stack" and assign the sudo permissions or privileges. To create a stack user, run the following command in your terminal:

```
$ sudo useradd -s /bin/bash -d /opt/stack -m stack Output :
```

```
nikita@JTP:~$ sudo useradd -s /bin/bash -d /opt/stack -m stack
nikita@JTP:~$
```

Now, to assign the sudo privileges to the stack user, run the following command :

```
$ echo "stack ALL=(ALL) NOPASSWD: ALL" | sudo tee /etc/sudoers.d/stack Output :
```

```
nikita@JTP:~$ echo "stack ALL=(ALL) NOPASSWD:ALL" | sudo tee /etc/sudoers.d/stack
stack ALL=(ALL) NOPASSWD:ALL
nikita@JTP:~$
```

You can switch to the 'stack' user by running the following command: \$ sudo su - stack Output :

```
nikita@JTP:~$ sudo su - stack
stack@JTP:~$
```

```
nmfc@nmfc-virtual-machine:~/Desktop$ echo "stack1 AL=(ALL) NOPASSWD:ALL" | sudo tee /etc/sudoers.d/stack
[sudo] password for nmfc:
stack1 AL=(ALL) NOPASSWD:ALL
nmfc@nmfc-virtual-machine:~/Desktop$ sudo apt install git -y
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following additional packages will be installed:
  git-man liberror-perl
Suggested packages:
  git-daemon-run | git-daemon-sysvinit git-doc git-email git-gui gitk gitweb
  git-cvs git-mediawiki git-svn
The following NEW packages will be installed:
  git git-man liberror-perl
0 upgraded, 3 newly installed, 0 to remove and 563 not upgraded.
```

### Step 3: Install the Git

In Most of the Ubuntu systems, git comes by default. But if git is missing on your system, then install it by running the following command:

```
$ sudo apt install git -y Sample
```

Output :

```
Activities Terminal * Wed 23:03
stack@JTP:~$ sudo apt install git -y
[sudo] password for stack:
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following packages were automatically installed and are no longer required:
  liblvm9 linux-headers-5.3.0-28 linux-headers-5.3.0-28-generic linux-image-5.3.0-28-generic
  linux-modules-5.3.0-28-generic linux-modules-extra-5.3.0-28-generic
Use 'sudo apt autoremove' to remove them.
The following additional packages will be installed:
  git-man liberror-perl
Suggested packages:
  git-daemon-run | git-daemon-sysvinit git-doc git-email git-gui gitk gitweb git-cvs git-mediawiki
  git-svn
The following NEW packages will be installed:
  git git-man liberror-perl
0 upgraded, 3 newly installed, 0 to remove and 0 not upgraded.
Need to get 4,741 kB of archives.
After this operation, 34.0 MB of additional disk space will be used.
Get:1 http://in.archive.ubuntu.com/ubuntu bionic/main amd64 liberror-perl all 0.17025.1 [22.8 kB]
Get:2 http://in.archive.ubuntu.com/ubuntu bionic-updates/main amd64 git-man all 1:2.17.1-lubuntu0.7 [804 kB]
Get:3 http://in.archive.ubuntu.com/ubuntu bionic-updates/main amd64 git amd64 1:2.17.1-lubuntu0.7 [3,915 kB]
Fetched 4,741 kB in 58s (81.9 kB/s)
Selecting previously unselected package liberror-perl.
(Reading database ... 205033 files and directories currently installed.)
Preparing to unpack .../liberror-perl_0.17025.1_all.deb ...
Unpacking liberror-perl (0.17025.1) ...
```

### Step 4: Download OpenStack

Once you install the git, use the git command to download the DevStack from Github.

```
$ git clone https://git.openstack.org/openstack-dev/devstack Output :
```

```

Activities Terminal
Wed 23:08 ●
stack@JTP: ~

stack@JTP:~$ git clone https://git.openstack.org/openstack-dev/devstack
Cloning into 'devstack'...
warning: redirecting to https://opendev.org/openstack/devstack
/
remote: Enumerating objects: 46270, done.
remote: Counting objects: 100% (46270/46270), done.
remote: Compressing objects: 100% (21153/21153), done.
remote: Total 46270 (delta 32710), reused 37537 (delta 24410)
Receiving objects: 100% (46270/46270), 9.50 MiB | 720.00 KiB/s
, done.
Resolving deltas: 100% (32710/32710), done.
stack@JTP:~$
```

## Step 5: Create a DevStack Configuration File

First of all, go to the devstack directory by running the following command : \$ cd devstack Output :

```

Activities Terminal
Wed 23:12 ●
stack@JTP: ~/devstack

stack@JTP:~$ ls
devstack examples.desktop
stack@JTP:~$ cd devstack
stack@JTP:~/devstack$
```

Now, create a local.conf file in which you have to enter the four passwords and the host IP address : Output :

```

File Edit View Search Terminal Help
stack@JTP:~/devstack$ vi local.conf
```

Copy the following line of content in the file :

[[local|localrc]]

```
# Password for KeyStone, Database, RabbitMQ and Service
ADMIN_PASSWORD=StrongAdminSecret
DATABASE_PASSWORD=$ADMIN_PASSWORD
RABBIT_PASSWORD=$ADMIN_PASSWORD
SERVICE_PASSWORD=$ADMIN_PASSWORD
```

# Host IP - To get your Server or VM IP, run the 'ip addr' or 'ifconfig' command  
HOST\_IP=192.168.56.103 **Output :**

```
stack@JTP: ~/devstack
File Edit View Search Terminal Help
[[local|localrc]]
#Password for KeyStone, Database, RabbitMQ and Service
ADMIN_PASSWORD=StrongAdminSecret
DATABASE_PASSWORD=$ADMIN_PASSWORD
RABBIT_PASSWORD=$ADMIN_PASSWORD
SERVICE_PASSWORD=$ADMIN_PASSWORD

#Host IP - To get your server or VM IP run the 'ip addr' or 'ifconfig' command
HOST_IP=192.168.56.103
~
```

Press the ESC, then wq to save and then exit from the local.conf file. Here, ADMIN\_PASSWORD is the password that we will use to log into the OpenStack login page. The default username for an OpenStack is 'admin'.

And HOST\_IP is the IP address of your system. To get your Server or VM IP, run the 'ifconfig' or 'ip addr' command.

## Step 6 : Install OpenStack with DevStack

To install and run the openstack, execute the following command : \$

```
./stack.sh
```

DevStack will install the following components:

- Compute Service (Nova)
- Image Service- Glance
- Identity Service-Keystone,
- Block Storage Service - Cinder
- OpenStack Dashboard - Horizon
- Network Service - Neutron
- Placement API - Placement
- Object Storage - Swift

The installation will take about 10-20 minutes, mostly depends on your internet speed.

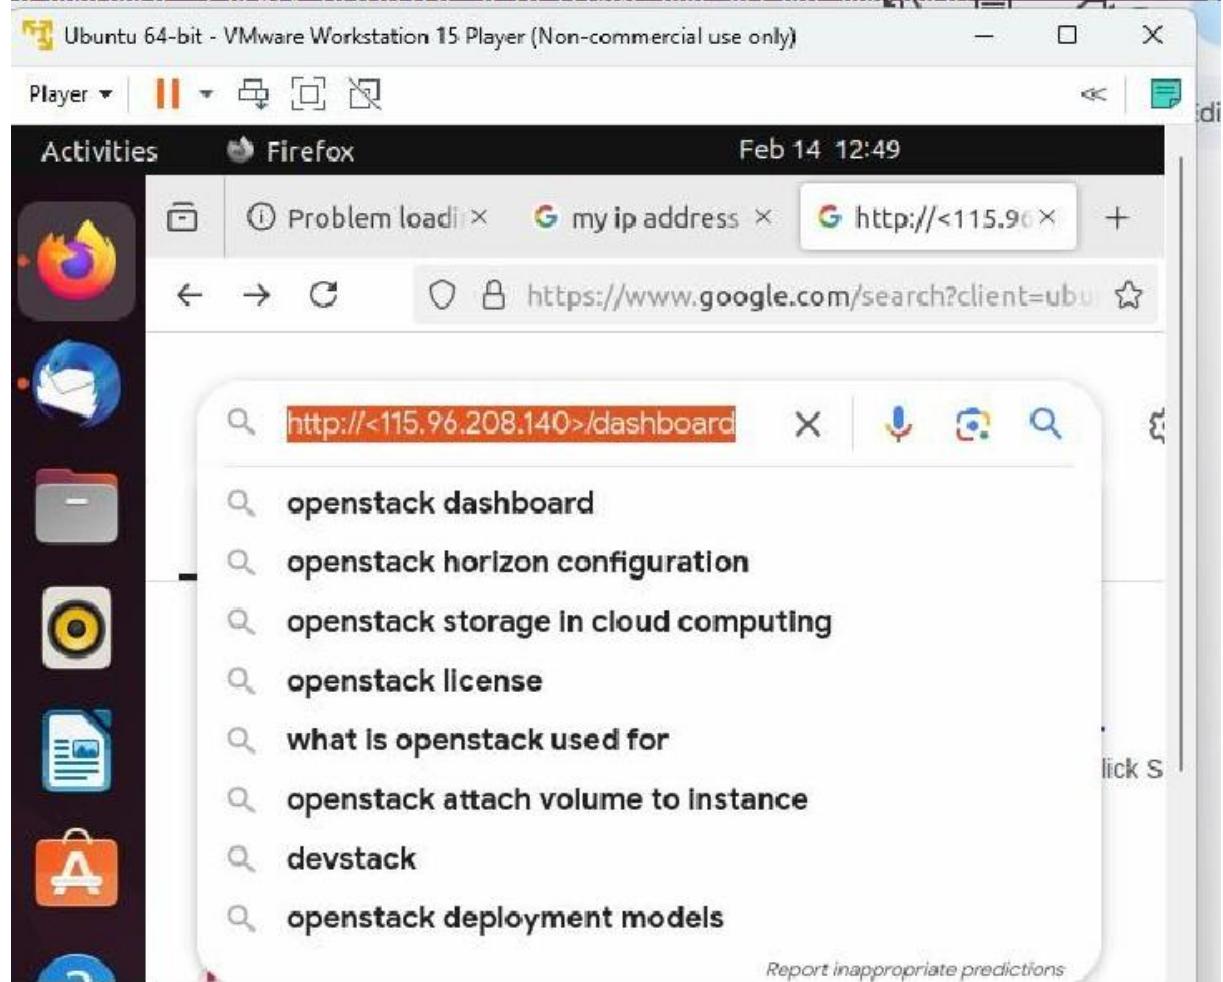

At the very end of the installation, you will get the host's IP address, URL for managing it and the username and password to handle the administrative task.

## Step 7: Accessing OpenStack on a browser

Copy the horizon URL given in the installation output and paste it into your browser :

```
http://<IP Address>/dashboard
```

```
nmfc@nmfc-virtual-machine:~/Desktop$ echo "stack1 AL=(ALL) NOPASSWD:ALL" | sudo tee /etc/sudoers.d/stack
[sudo] password for nmfc:
stack1 AL=(ALL) NOPASSWD:ALL
nmfc@nmfc-virtual-machine:~/Desktop$ sudo apt install git -y
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following additional packages will be installed:
  git-man liberror-perl
Suggested packages:
  git-daemon-run | git-daemon-sysvinit git-doc git-email git-gui gitk gitweb
  git-cvs git-mediawiki git-svn
The following NEW packages will be installed:
  git git-man liberror-perl
0 upgraded, 3 newly installed, 0 to remove and 563 not upgraded.
```

**Conclusion:** Hence we have successfully implemented Openstack with user and private network creation.
